ACKNOWLEDGEMENTS

To Tym Mott-Smith, computer scientist, for checking through the material; to all sources of spiritual transmissions: Hilarion (through Maurice Cooke), the Unarius texts (Ernest Norman, Ruth Norman and Charles Spaegal), Tuella and spiritual contacts, The Urantia Book, and many more.

Full acknowledgement is being given here (and references in the bibliography) to these spiritual sources rather than making constant specific reference in the text, which owing to the amount of material gathered, compared and analysed would distract from the readability. The reader is recommended to make use of the bibliography and follow through on many of the sources.

Cartoon poster, ROUTE TO HEAVEN, 18"x20". Price \$3 each - plus \$2 postage and mailing tube, for 1 to 5 posters, from Prescience Publications, 1330-1/2 Sutherland Street, Los Angeles, CA 90026.

PREFACE

A glance at the title and subheadings of this book may convey the impression of a large amount of diverse and unrelated material. However, this is not the case. There is a very definite theme and coherence of data relating all significant facets of man's physical and spiritual experience, supported by scientific principles: his origin, evolution and purpose; his loss of unity and present precarious predicament; intervention from the Galactic Confederation and spiritual hierarchies; the creation of, and problems within the three-dimensional worlds, such as Earth; and his inherent drive towards a greater and more enlightened existence in the higher worlds.

The undermining crucial and determinant factors of man's evolution are his propensity for ego development and self gain, along with technological advancement and its potential misuses. Consequently, the psychology of the ego is given particular attention in the book to bring home this underrated and neglected source of aberration and failure of man and civilization.

Man's predicament to day of a world of turmoil and strife, of spiritual ignorance and uncertain future, typifies that of many past civilizations which terminated in their self-inflicted demise. At present, corresponding crises on Earth are imminent, leaving only two alternatives: the anticipated Golden Age, or annihilation.

It is clearly evident that man's existence is not random, but overshadowed continually, and part of a greater plan of the Infinite, in which obstacles are purposively encountered, such as ego entrapment and the negative forces which must be overcome in man's evolutionary "escape" route to his greatest experience, beyond his wildest dreams, of ascension into the higher-dimensional realms.

DESTINY OF PLANET EARTH

What is the destiny of our Earth? Is it one of predicament or revelation?

The Bible prophesies its future and the whole of Christianity embraces this prediction within its teachings unquestioningly. How far do present observations and the considerable available relevant data support the implications? Are we in a position to comprehend what the Christ bestowal upon Earth, 2000 years ago, was all about, in relation to current events, scientific advancements, evolution and consciousness development and the wealth of transmitted information from so-called spiritual hierarchies?

The answer is very much in the affirmative.

Correlation of all such diverse but pertinent information is occurring and indicates a constructive evolutionary path, putting into perspective science, religion and the occult, and presenting an overview which the non-religious layman or intellectual can understand, and at the same time filling in gaps of religious knowledge, and raising the truth and accuracy level of the interpretations. We can reveal an overall coherent picture of man's true purpose, his actual past and inevitable future and the nature of his continuous spiritual existence, and disclose the essential character of the lower Earth-type worlds, how they are formed, and their exact purpose; also the nature of higher worlds described as heaven in the scriptures, what is meant by God is Light, and the Jesus/Christ/God relationship. The UFO visitations are now clearly recognized and understood, including the extraterrestrial's interest in planet Earth and their degree of intervention in planetary affairs.

It is being recognized by the present civilization of Earth that it is not only undergoing a materialistic decline, paralleling previous civilizations on Earth which destroyed themselves, but that a much more drastic and final destiny is imminent. Armageddon can now be understood more lucidly and logically. Its real significance and relationship to man's origin, his past and his future is clearly evident.

According to spiritual-hierarchy transmissions the human life-stream, which has associated mainly with this planet's human population throughout thousands of years, when originated, was endowed with certain specific Divine characteristics as - what we would call - an experiment. The full consequences of placing such a quality within a consciousness, which would go through the lower worlds, was known and agreed upon by our collective consciousness. The long and arduous path of its evolution from collective soul to individuation of souls to a drastic but predictable **overrun** into the **extreme individuation** of negative ego states, is finally culminating in what is described as Armageddon or the Second Coming of Christ.

The planet is on the brink of World War III; a pole shift is predicted by academic scientists, psychics and extraterrestrials alike; we have the prophecies of the Bible chapter, Revelations, and the Tribulation prediction of a chemical cloud entering the Solar System igniting the oxygen of the atmosphere; fringe groups of scientists foresee the possible Nova of the Sun (an extreme explosion of light and heat), the Greenhouse Effect (global heatwave caused by trapped combustion gases in the atmosphere), anticipate encroaching comets or other bodies threatening the Solar System; and last but not least the extraterrestrials have communicated that our planet has been held steady on its axis since 1981, using the force-fields of millions of spaceships, but that this intervention cannot continue.

Man has gone through the phases of what has been called the Temptation (initial downfall of man), the great Flood and further destructions of civilizations, and is due for the Tribulation (Armageddon) and the Transformation.

The purpose of the transformation, a period of a thousand years, is one in which the selected section of the human race, which will be separated from the remaining part, is transformed into a higher level of consciousness along with corresponding basic vibratory changes in the planet. In effect, the Earth is to be transformed into the higher dimensions - its present form will evolve out of this three-dimensional matrix with fundamental changes to the vortices of atoms and the planet (see Appendix B). Note that a counterpart of Earth can remain if it is necessary for Solar System balance or for other evolutions of consciousness.

The remaining, more negative population could be left behind on this "other" Earth of lower vibrations but information indicates their being taken to another system, and in some cases that absorption of identity within the Infinite has been disclosed.

These predicted changes are attracting the extraterrestrials in their spacecrafts who on the average are much more advanced spiritually than Earthlings, and are actually playing a dedicated role in Earth's destiny.

Now in addition to the two major divisions of the path consciousness can take, that is, up scale to higher spiritual levels or down scale into greater negativity, the positive up scale development can be divided into two routes for man's ascension. There is 1) individual expansion of consciousness, and evolution to the higher worlds (hence "Escape from the Universe") or 2) more collectively selected population en masse, with the development also of the planet, all into the higher realms. Such a concept is totally foreign to science which has no knowledge of the correct configuration of atoms (see appendix B) and how matter and space can evolve identically and in a parallel manner, with those energy configurations of consciousness.

Since man has failed repeatedly in the past to free himself from the materialistic fetters of the Earth-type existence and evolve to the higher worlds (his purpose), the more drastic measure is being taken of separating the "good" from the "bad," removing the bad, or negatives, and allow consciousness' evolution of the

spiritually-progressive individuals, unhindered by the remainder.

Whether a person achieves this freedom and development individually or collectively, the nature of the psychological, physical and vibrational changes is the same, with which this book deals.

Darwin's Theory of Evolution has little applicability to reality. Physical evolution and spiritual evolution have different lines, but interact. Over thousands of years man has devolved towards a stronger three-dimensional (3D) ego identity with loss of consciousness, deteriorating and closing chakras of the inner bodies, emphasis on self and inability to unite consciousness with that of other individuals, lifeforms or kingdoms on this planet (all, however, predictable and within the Infinite's plan).

In effect, man, indoctrinated by his past, his present life experiences and education, has become a three-dimensional robotic intellectual (although there are enormous variations) operating essentially on the mechanism of physical senses and 3D intellect. To this degree, and consciousness' isolation, his vibrational rate reduces. Accompanying this, the vibrations of space and atoms reduce in frequency giving greater density to aetheric mass, greater division of unity into the opposites, and a more **objective** world; that is, one separate from man, exactly according to his reality (and academic science) and one with time and space which cannot be controlled consciously. Looking on the dark side, the scope for suppression and control of man hardly needs indicating.

Thus the ego creates the physical universe trap (the constraints of enforced objectivity), and this ego has in this world reached its limits of "development." A natural and automatic process occurs in which the ego reaches a point of magnitude creating so much disharmony that it destroys itself even though this may be quite correctly assigned to God's, or the spiritual hierarchy's intervention.

No amount of argument, justification or excuses can change these facts. What is considered psychologically average in our society, is highly negative. Man has pushed the separation of the positive and negative of

the 3D vibration of his lower self too far, in the dichotomies, good/evil, etc., and action/reaction, and must return to the balance point and raising the 3D oscillation to its point of elimination within the four-dimensional (4D) oscillation (technicalities in appendices).

The crisis is imminent, but for the majority this book should help mitigate reactions to the severe changes and give a deeper understanding of accompanying possible calamitous events leading to the cancellation of negativity and the emergence of the Golden Age.

CHAPTER 2

TO REINCARNATE OR NOT TO REINCARNATE?

Firstly, in handling this question, we are not going to burden the reader with hackneyed and oft-repeated countless examples of documented evidence in favor of past lives. The information is extensive and embodied within all the major teachings of advanced knowledge.

The affirmation of past-life existences is also corroborated and emphasized without recourse to justification by all spiritually-channelled sources, with one exception: The Urantia Book material, although, strictly, this material was purported not to have been channelled, at least, that is, not through man.

SCIENCE AND CHRISTIANITY

In contrast to the evidence in favor of reincarnation we have the opposing view, that of one lifetime per person, taught by Christianity and The Urantia Book, and which is an inevitable consequence of academic science. However, we have to add that academic or established science (barring the potential implications of quantum mechanics) is riddled with flaws and utilizes a naive three-dimensional framework as its basis, is devoid of a Creator, and embraces low relative causation and truth. Such official science deals only with the more physical 3D spectrum of energies and consequently does not embrace the spectrum involved in continuous life - thus denying it.

Christianity, in spite of its extreme opposite view to established science, that of Deism as opposed to atheism, runs surprisingly parallel to science in its interpretive basis. The main element being that both science and Christianity are based on knowledge or interpretations from the ego - a viewpoint of mere physical perceptions. Both science and Christianity

discredit the potentiality of man's supersenses: science denies anything outside the 3D range of perceptions, and Christianity associates them with black magic and the occult, which ironically results in suppression of man's development into higher spirituality.

Science recognizes a 3D particle world of superficially interacting parts or elements in a precise manner, as interpreted by the ego viewpoint. The ego observer does not perceive a high degree of reality but only its own interaction with reality, creating the space-particle view, and to that degree its reality is an illusion.

Christianity also makes judgments on a superficial 3D basis and one fully in keeping with the separateness characteristics of the ego. Remember that the ego channels higher consciousness but constrains the consciousness to the sheer mechanisms of our five senses, plus mechanical thought patterns (moulds) based mainly on the huge limitations of language. The ego tends to function as though it is the only self, and views itself as all important. Similarly a "collective" ego considers itself the center of the universe and the only existing intelligent creatures. God is viewed as being in the sky or across space somewhere, and is humanly personalized.

The ego view is thus highly prejudiced and unreliable, incapable of making judgments without reference - consciously or unconsciously - to its isolated self.

As a final point on the Christian view of reincarnation, it has been channelled from a lofty and highly reliable source that around 500 AD the Constantinople Council decreed that any reference to reincarnation in the scriptures would be removed. Also, it is said that Jesus referred to past lives and was, in fact, educated amongst the Essenes who recognized man's multiple lives.

REINCARNATION FAVORED

On both accounts, that of science and Christianity, neither have sufficient basis to undermine reincarnation. Christianity, however, has a good point - although of only partial validity - regarding "demons"

or the Dark forces infiltrating man's mind with visions of past-life incidents to place deliberately such ideas into his head. This does occur. Many mental images are the result of astral entities tuning into man's mind and ironically many of these pictures may be from their (the entities) past lives.

However, negative entities (such as demons) attempt to **prevent** man from recognizing the existence of his past lives, along with blocking an understanding of his karma. The reason for this is simple and logical: a knowledge of past lives and karma enables man to see the causes of his problems and ailments and subsequently gives him the opportunity to erase these causes making him well and able to evolve to higher states of consciousness. The negative or Dark forces, like parasites, need to feed on man's energies in order to prolong their existence and boost their experiences (see chapter on negative forces).

Now the most problematical source of refutation of reincarnation is the **Urantia Book**. This book must be the most startling and perplexing book in existence. Over 2000 pages, it is perfectly written, and clearly authored by above-human intelligences. A long list of spiritual authors is given, some recognizable in our scriptures. We shall cover more on this astonishing book later. Needless to say it denigrates the concept of past lives, describing it as stultifying and debilitating. The route or journey man takes after death is given in no uncertain terms and presents a very attractive outlook for his or her future with carefully graded steps to spiritual enlightenment.

PAST LIFE OCCLUSION

The question naturally arises as to why we do not normally recall past lives. Firstly, let us correct this and mention that some people do naturally remember previous lives, in particular, children and more emphatically, the American Indian.

Certain tribes of the red races are noted to be the most advanced spiritually, according to spiritually-transmitted information. This makes sense for various reasons: their psychic channels are more open; they live their religions; recognize and perceive the devas or

spirits of the plant kingdom, of lakes, waterfalls and mountains; they recall family members from past lives; have languages free from the terminologies of "hate" and "divorce", etc., and even dwell, or originally dwelt in spiritually and geometrically superior constructions - the teppee, round base with conical (compare pyramidal) shaped enclosure.

Now regarding lack of recall of past lives of the general population, one explanation given by Hilarion and easy to agree with is that memory occlusion was brought about to give man a better chance of overcoming the many negative aspects of his past. This may at first sound contradictory. But too much available negative past could rise to the surface of man's consciousness and overburden him. Thus although these past negative acts have to be cleared up, as they form part of his soul body, the occlusion enables this to be done in a **steady controlled manner** allotting a calculated quantity of his own negativity to a particular lifetime. Such administration is done by appropriate beings from the spiritual hierarchy: guides, guardians, etc.

HIGHER-DIMENSIONAL CONCEPTS OF PAST LIVES

Since the Urantia Book comprises material which cannot be ignored, can we reconcile their one lifetime per person with the multiple lives theory? The answer may well lie in the fact that man cannot grasp the higher logic involved, and the Urantia Book deems to take one viewpoint and other sources the other viewpoint of a multidimensional situation. This is where concepts become difficult to comprehend.

Firstly, we can consider a lower self projected from the soul into a physical life. Now on the basis of the Urantia Book data the lower self has one lifetime, leaves the physical body then goes through a series of levels of development through "morontia" (a plane between physical and spiritual) to higher spiritual realms. Since it is generally understood that a being has free choice, he could, with the aid of advice and tutoring, be made to choose not to reincarnate but have all his problems handled on upper levels. For example, the Urantia material does refer to a plane in which all

man's problems or incomplete goals are acted out using a creative framework of instantaneous materializations of thought (which would be equivalent to Hilarion's "Summerland"). Nevertheless, from the arguments which follow it is not necessary to rely on this factor of free choice in deciding not to reincarnate, which is unsatisfactory since the alternative of reincarnation still holds.

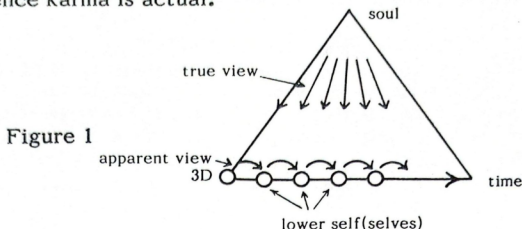

Our argument is as follows. This lower self, after physical death, returns to its soul but its identity, as the lower self, not only remains but can still operate individually and develop! As it moves up scale so does the soul. It can eventually become equivalent to what the soul was (in terms of development) but the soul is then more than it was.

We can see that very gradually this material is becoming more compatible with the reincarnational view. We now have the consideration of many different lower selves. The nature of consciousness, higher dimensionally, is such that the lower self is the soul and not the soul simultaneously. This is an example of higher-dimensional logic and not fully translatable into simple and limited 3D logic. The lower self is an expression of the soul and can act independently within its restricted degrees of freedom but is nevertheless within the soul - just as man is within God but more "detached" than he is with his soul.

Thus all we are trying to explain is that there is really no difference between stating that 1) a lower self of the soul goes from one life to another or 2) the soul has many different lower selves each having one lifetime, but since the lower self is the expression of the soul, on the basis of the whole within the part, then each lower self can be considered the same one, and we are back to (1).

This contrivance of logical thinking is supported by the fact that the higher-dimensional viewpoint of several past lives is that they are simultaneous from this level. Cause and effect are simultaneous at this higher dimension (and this is why karma, a strict law on a lower level, can be bypassed from a higher level). Therefore, on this basis and from the 3D viewpoint, there must be multiple lower selves - see Figure 1.

Note that at this lower 3D level time sequence and hence karma is actual.

If we consider then that our past lives involve a lower self or consciousness, which is not this one in this life, then from this viewpoint we as the lower self only have one lifetime. But the soul has many lifetimes within its many lower selves, and therefore from this viewpoint, since the soul (whole) is within the lower self (part) the soul can be said to project a lower self into many lifetimes in which the lower self goes (or appears to go) from one life to another. Thus it all depends on where one wants to delineate the boundary around or within consciousness to identify a self entity.

Each lower self after physical death normally returns to the soul (and ideally should), but it can still operate independently and continue to develop or remain dormant. The soul expands or moves up the hierarchy as a more integrated entity, as the lower self develops, until eventually all lower selves (or the lower self, whichever one chooses) have completed their physical lives. These lower selves can each become the equivalent of a soul (but fully within and overshadowed by the original soul - if desired) then project their own lower selves into physical planes involving initially perfect lower selves or ones expressing some remaining discrepancies not fully handled within the developed lower selves or soul. Thus this is a system of further refinement or second order of consciousness development, and so on to further orders.

The above cannot be understood if any boundaries are envisioned permanently between regions of consciousness. The boundaries exist and don't exist

simultaneously. Our language and 3D intellect cannot express the qualitative difference between these two.

HOW MANY LIFETIMES PER PERSON?

There is enormous disagreement on this question, even amongst reputable sources. The human being has existed for many millions of years on this planet and others, and has been in more advanced forms than the present one. There is thus scope for very many lives.

Scattered sources of information on past lives seemingly not highly versed in this subject will refer to a handful of past lifetimes per person. Now Hilarion mentions around 50, with exceptions. The Eckankar master, Rebazar Tarzs, gives 84 as a possible maximum, corresponding to seven lifetimes in each zodiac sign (or twelve signs and calendar months), but a person's progress to attainment of the higher worlds may be speeded up and a smaller number of lives may be experienced. The Unarius Foundation (over eighty books transmitted) and Scientology philosophy have compatible estimates of thousands of past lives up to countless numbers. As a final example, channel Tuella, refers to at least 100,000 life tracks before a being returns to God. Results of past-life recall of students of some of these bodies of knowledge can verify, as far as this subjective experience is reliable, the order of magnitude.

Thus the data on this area of knowledge is very confusing for man, and from the viewpoint of the non-believer these discrepancies would appear to throw doubt on the authenticity of past lives. A possible answer to this is that information in this area available for man is being limited and confusion actually allowed to occur. There are reasons why man must not be given too much knowledge in certain areas. It can not only affect his decisions, choices and attitudes, thus influencing the path he takes, but also alter karmic interactions regarding efficiency and learning, and possibly cause suppression of cognitions of the undeveloped higher self (through the lower self).

Returning to the question of the number of past lives, sometimes reference to cycle of lives is made, implying the presence of other cycles of past lives.

Also Eckankar information states that periodically (presumably an extremely long time) the lower worlds (our universe, etc.) are destroyed and begun again. Scientology refers to similar periods. Thus we tend to have circumstances in which we are judging too small a piece of the whole.

Looking at the obvious evidence for reincarnation a close examination of the psychic make-up of man, his abilities, reactions, problems, indicates that he came into this life with sometimes countless preset impulses, which have to be based on previous (other) existences. Thus we have to accept that either man reincarnates, or his soul incarnates many lower selves. The view this book inevitably will take is that of the truth of reincarnation as proposed and presented in this chapter. However, any explanation involving reincarnation must be recognized as only an interpretation. We could, for example say that the soul projects various characteristics of itself into lower planes (called lives), even at once, and these characteristics may interconnect (past-life effects, or even future ones, into a present life) giving an opportunity for any characteristic (lower self) to solve any ("self's") problem.

As a final comment on the above-mentioned allowance of confusion into the data man receives from various transmissions, if everything was made clear or presented too positively, man would not be in a position to choose or work anything out. For example, even the most negative or skeptical person could be convinced of the existence of God by means of miraculous displays. However, this would interfere with the basic changes and realizations within this person (lower self), inhibiting required changes in his soul.

Another type of confusion can arise from apparent errors and contradictions in transmissions. This is due to man's "unknowns" not being at one particular level (of difficulty), some of these answers are sometimes above the level of higher beings. Thus answers on these particular problems may be limited, and varied from different sources.

CHAPTER 3

THE PRECOCIOUS EGO

It is necessary to bring to light numerous factors which determine and reveal the present level of consciousness of man; what factors elevate his state and what lower it. Exposing many of these characteristics, foibles, failures of man will tend to react on the ego of the recipient. This is to be expected and should merely be confronted and admitted to awareness.

The subject of the ego is very deceptive; it is much more significant as a determinant factor in our mental and spiritual progress than is generally known. There is very little or no information on what the ego really is, in particular, how it relates to man's objective environment and his problems. These feature will become more clear throughout the book.

Now at some point in his evolution, man has to subdue the ego dominance within his personality to permit development and evolution of consciousness. Ironically, this can sometimes be a more painful and accentuated task the more able one is. A successful person, one who can make everything go right for himself, one who attracts and commands a great deal of attention, inevitably constructs a reality in the form of ego structures corresponding to these supportive and pleasant circumstances. A dependence on the continuation of these happiness-inspiring situations is created, resulting in compulsions, needs, intolerance of any lack, a reliance on the environment to stimulate good effects within him, etc.

Most people would not consider any of these effects bad and would not wish to change them. All realities have validity and each operates according to where he is awareness-wise and what he needs to learn. One person's mental case cannot be compared with another;

each has a different past, different spiritual goals and plans made at the higher-self level to be worked out and completed in particular lives, and sometimes at particular times within these lives.

Before elaborating on the characteristics of the ego and revealing the need for its eventual sublimation to permit spiritual progress, let us describe briefly the parts of man's mind.

THE MIND AND ITS PARTS

The mind is a very broad term and it can embrace the subconsciousness, the consciousness and the super-consciousness. These are the three main divisions. The superconsciousness is the higher self or soul (these terms will be used interchangeably) - comprising an initial allotment or "volume" of consciousness but which can be integrated into a more complete identity and elevated within the Infinite. This soul will operate on and be consciously aware of the conscious level with little or no use of automatic mechanisms.

The conscious mind is a projection of lower frequencies of consciousness from the soul which operates much more in a computational manner on stored conscious or subconscious data. That is, it has 1) lower harmonic properties of the higher self, giving information or data directly from the soul in the form of intuition and potential paranormal or super senses (perception beyond the physical senses) and 2) computes on any stored data from all experiences, in particular, all memory in the subconscious mind.

The subconscious mind operates on the framework of data and experience given to it by the conscious mind or independently of the conscious mind. If it has good programs it will playback good programs to the conscious mind, and vice versa. It is a very powerful source, and can totally rule or wreck a person. All experience is recorded. At times of stress or trauma the conscious mind is in a state of low awareness, backs off, and recordings go into the subconsciousness bypassing the conscious mind and leaving no intellectual data line between the two. However, such areas of the subconscious mind when reactivated by similar experiences in life, will still impinge on the conscious mind via the

emotional lines but leaving no knowledge of what is effecting the conscious mind. In Scientology philosophy this is called the reactive mind, and every imaginable facet of this mechanism and its effects has been researched and documented. We can consider the subconscious mind as partially over-lapping with the conscious mind giving a region of consciously available memory within the subconsciousness, such as semi-forgotten data experiences and learning patterns involved in, for example, physical coordination.

THE NATURE OF THE EGO

Superficial aspects of the ego are easily understood but a thorough grasp of its nature is difficult and takes time and observation. The ego forms the framework for the lower self identity and includes areas of both conscious and subconscious minds, but not the higher self.

There is what we can call a **natural ego** which is formed from given drives related to self, partly programmed, partly acquired, in particular, self-preservation and survival. Physical perception is dominant, enabling the recognition of a consistent three-dimensional environment involving a viewpoint only from the body.

Thus the basic or natural ego state is a valid one and has a purposive and constructive identity. It is an exterior aspect of consciousness which is tuned to three-dimensional events. The exterior 3D universe itself is created or manifests simultaneously with the ego. Consequently, the ego can be regarded as a 3D identity totally relevant to 3D Earth-type existence. For example, the ego is necessary to give the developing new-born child a framework or a "template" to select 3D exterior events. The child thus stabilizes and focusses into that part of consciousness which interfaces with this universe. It "learns." Unfortunately, it loses the other perceptions of dimensions beyond ours. All this is normal and necessary for adjustment into this 3D universe.

However, this natural ego also develops what we can call **extended ego** structures and realities, and this is where we find the physical universe trap. When this

3D ego identity forms compulsive extensions of itself it imprisons itself within the lower 3D materialistic worlds, such as an Earth life, and does not even wish to leave or evolve! The lower the frequencies of consciousness the more separate this ego identity becomes from its environment and other consciousness'. The universe becomes more objective, involving rigid space and time, and, in general this identity operates and communicates more via 3D space and time rather than using the finer abilities of consciousness. Before discussing further aspects of the ego let us consider three levels of man's mind development.

THE ADVANCED SOUL

Ideally, and at any instant in time, a person should be operating on the conscious mind perfectly in tune with the superconscious mind with no reactive sub-conscious effects at all. Any unawareness would only be of higher level processes and the automatic mechanisms operating the body.

Such a state would be that of a perfected being. His lower self and higher self form a unity. Guidance from the soul is unhindered; there are no opposing flows from the ego or conscious mind which would involve counter decisions and intentions. The goals of the soul set prior to the lifetime are being fully executed without resistance or distraction. Jesus, the man, would be in this category (apart from the higher Christ consciousness - see Chapter 17). In this advanced state, guidance from the soul will also include any additional aid necessary from other souls, since they can act collectively. Psychic abilities would be spiritually natural and not specifically developed.

Note that the lower self must always seek the higher self and the latter cannot cause the lower self to do this. This is the only way the harmonic polarizations (in-phase energy oscillations) can be acquired between the lower self and soul with the re-alignment of energies. As far as evolution is concerned this means that as much as possible must be achieved by the lower self in a lifetime. Between lives these energy distortions cannot be handled at the higher level except to preset their healing prior to a life. In which case they

would then only have to be catalyzed in that life by some positive action.

The soul of this advanced personality will be a highly integrated, personalized and qualified identity in the process of becoming free of disharmony or maladjusted wave forms.

THE AVERAGE BEING

The average person's mind is very much under the dictates of the subconsciousness. All unwanted reactions, aberrations, psychosomatics, negative considerations, etc., come from this area (negative astral forces also link up with these negative states - see Chapter 4). Positive force can also come from this and if programmed to do so, particularly when the conscious mind allows this by means of states (such as alpha or hypnosis) which bypass uncertainties, fears, etc.). The superconscious mind is not so integrated, or it could be well integrated but counteracted by a great deal of energy between the higher and lower self which is out of phase, with a great amount of past-life incidents and karma to handle. The conscious mind rarely acts in present time owing to the barrage of compulsive information from the subconsciousness due to constant automatic associations between present experience and past.

Now the ego will usually be strong, wanting only to have its own materialistic way, with emphasis on security for self, self gains, validation, esteem, fame, riches, and, in general, an environment which makes it happy. (These types of reactions in life will be explained later, scientifically, showing how they bind one to the lower vibrations.)

The conscious mind will be constantly biased by subconscious data and ego needs. All this activity blocks the superconsciousness. The basic energy comes from this superconsciousness or soul but it meets the lower mind with all its obstructions - stored energy going round in circles (circuits), opposite flows and counter thoughts, narrow channels from constricted chakras (energy centers connecting the body with its astral and spiritual bodies) and an ego which does not want this higher energy unless it supports the ego (and

sometimes the goals of both ego and soul do agree but the intentions and purposes would be different).

THE NEGATIVE INDIVIDUAL

In general, the negative person might be regarded as undeveloped, but, of course, the undeveloped, due to inexperience, may not be negative. A lowered state of consciousness is more accurate in describing this mind, but nevertheless the mind may have been highly advanced at one time - hence the expression fallen angel. In such an example as this his frequency rates have lowered and there is a great deal of out-of-phase energies (the higher states are still there but disconnected by out-of-phase energies).

Whether he was advanced or not this being is now well dissociated from his soul. He operates mainly with his conscious and subconscious minds. Most, or all of the time, his consciousness is under the dictates of the subconscious mind's contents which will now be highly aberrated - if it wasn't before the alienation of the soul. His ego has free rein. There is no, or virtually no guidance from the higher self. He makes all decisions from stored energy and data, and is devoid of constructive inspiration other than inventiveness for self gain.

Criminals have a strong type of ego. Their aberration creates blocks which enables them to commit harmful acts on others for self gain or not. This is all part of the suppression of consciousness. Factors which prevent its ability to span minds, duplicate and be other areas of consciousness, resulting in confining the awareness or viewpoint to self only, predisposes the individual to overt acts which involve obliviousness of the other's viewpoint.

The stronger the ego becomes through selfishness and bad acts the more it is the opposite of the collective state. Two people on the same wavelength and experiencing this consciously are in tune - resonant; they are sharing the same reality and there is no ego at that moment and within those reality structures. They are operating collectively. In the self condition the energies of consciousness do not combine to create resonance and unity - the energies are out of phase.

The most drastic and serious state of the ego, apart from severe illness and insanity is one in which the ego is an extended and powerful one but with low intelligence; or even worse, intelligence is high but the person is deficient in integrity, ethics, honesty, principles, etc. This is comparable to the hypothetical example of imagining a lion of the jungle endowed with severe ego aberration. Its whole natural behavior would change. It would become a menace to the animal kingdom. It would kill indiscriminately, and at times other than when hungry if the aberration so dictated. It would set itself up as having higher intelligence than other animals and would manipulate other lions to band together to trap and destroy other competitive carnivorous animals or, it would overwhelm by numbers, a selected target, say, an elephant whose superior size and stately (more spiritual) disposition irritated the lion's ego. We are trying to show the enormous dangers of the ego if given power and intelligence. This is the essence of the negative forces.

NEGATIVE FORCES

By negative forces we are referring to any source which hinders spiritual progress of consciousness both as a direct effect plus all the indirect ways in which survival or progress is prevented. Such a negative force is not to be confused with the negative force involved in simple polarity, such as the positive and negative aspects of an atomic vibration. In this latter context, positive and negative are interchangeable and of equal merit if one is reversed mirror-image-wise relative to the other (see chapter on vibrations).

SOURCES OF MAN'S NEGATIVITY

Sources of negative forces are 1) subconscious or unconscious recordings of past experiences of a negative and emotional nature containing both misaligned wave forms and pressure of emotional charge, 2) thoughts developing into thought forms of a disharmonious, destructive or, in general, negative kind, and 3) astral entities with egotistical or negative purposes which tune into man's mind and/or become parasitic of his energies.

However, none of the above are independent of the others. For example, negative entities will associate with thought forms and sometimes negative recordings in the subconscious. These entities are invisible to man (to his normal physical perceptions) and exist within the subastral planes or lower regions of the astral plane which is within the third to fourth dimensional range.

Not all bodies of knowledge agree that such negative entities exist, and such "demons" will be attributed to unconscious circuits, obsessional complexes, split personality or thought forms, which do, however, also exist. Christianity, as a result of Jesus' reference

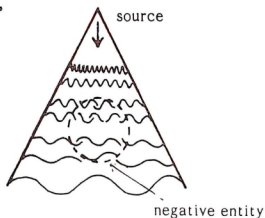

to negative entities very much accepts the reality, and they are often referred to as the Dark forces or demons.

The reason for the term "dark" is due to the fact that there really is an absence of light. However, this light extends well above the visible band in the spectrum and all things, space, matter, life, etc. are created out of forms of light energy (see chapters on vibrations and light). The darkness or reduced intensity is due to lower frequency (less radiance), and out-of-phase energies.

Further references to "light" will have initial capital when applying to the basic energy of the Infinite; for visible light lower case will be used.

How did these beings or entities become destructive and negative sources? All living things originate within the Infinite or God, but God would only create perfect forms - flaws would have to arise indirectly. Such entities have chosen a downward path of ego self-gain which results in eventual negative and destructive acts. This means the energy relationship of their consciousness goes out of phase with cosmic energies and the Infinite (which is the whole upper spectrum of harmonious light energies increasing in vibrational rate into the heart of the Infinite).

Figure 2

Their consciousness is being restricted more into self and severed from its source - the cosmos, God, etc. The entity's energies become out of phase and more isolated from its creator and therefore its source of energy - see simple diagram of Figure 2. All energy comes down the scale from higher dimensions or the higher realms (apart from temporary storages at the lower levels).

The more the entity becomes separate from its origin, the more unethical it becomes, since its awareness is centering into self and unable to experience responsibility for other areas. Eventually evil follows, and in turn it becomes still more separated. A vicious circle is set up. The high frequency radiant energies of the Light are not replenishing or resonating the entity's energies of consciousness, and it becomes like a dwindling flame destined to eventually become extinguished.

Its frequencies of consciousness also become lower, since existence at higher vibrations cannot contain evil, owing to the harmonic nature of the energies and complete perception, understanding and experience of another's viewpoint, and the unity of the opposites, positive and negative, above the fourth dimension (see Chapter 18).

PARASITES AND POSSESSION

Since the entity has lost its harmony with the Light it must feed on the energies of other beings who exhibit, even if only occasionally, similar vibrations. Thus negative thoughts or actions by humans will instantly attract negative entities who can associate with and resonate on those frequencies. In superficial cases when this happens man will not usually detect anything, since any debilitating effect and lowering of consciousness will often manifest gradually. However, there are severe cases where, for example, sufficient intake of alcohol can open up the electromagnetic field at the back of the head, enabling the Dark forces to enter and control the brain of the person, giving rise to the possibility of taking complete control of the individual's action. Murders may be committed in this state. Although this sounds highly severe and unfortunate for the victim, remember that such negative circumstances are attracted by the person through the alcohol and other past negative actions and affiliations with negative beings.

Note that excessive smoking, as well as alcohol intake, distorts the astral body, of which the malformations are visible after physical death, and impairs the thin sheath - supposedly one molecule thick - at the

chakra portals of throat and solar plexus allowing the ingress of negative entities. Such a sheath is designed to allow penetration of positive high-frequency spiritual energies but blocks lower frequencies and negative energies.

Thus there are different degrees of contact from negative entities - ranging from the more direct and dangerous control through the chakras, the brain and nervous system, to tuning in on the same wavelength at any distance (see Chapter 9 for the principles of resonance).

TYPES OF ASTRAL ENTITIES

These astral entities will vary considerably in type, degree of consciousness and power. Some, which have become associated with the negative past recordings of the subconscious mind, will be unaware or unconscious and have no direct bad intentions towards the person or host but simply react negatively to situations, exaggerating the host's behavior and dramatizations. Also, many of these entities will be used or controlled by more awake and intelligent negative sources, adding to their own power.

Thought forms are built up from repeated anxieties, fears, obsessions, worries, etc. In themselves, these thought-form structures are living energy and attract like (similar) energy or forms, with no limit to the build-up. Collective consciousness of man has created enormous negative thought forms which have been said to surround this planet like a green mist. People's thoughts are constantly adding to and reinforcing these collective thought-forms. Also, certain negative thoughts and incidents will tune people into the thought forms creating viruses, such as that of the incurable common cold.

Christianity only recognizes the most severe type of negative entity referred to as a demon, not appreciating that there is a complete range involving helpful or partially helpful entities with sometimes good intentions but unreliable; also ones operating mainly for self, just like most people's friends and neighbors. As elaborated upon in other chapters, Christianity operates a great

deal on the dichotomies - good or bad, etc. - as does science, in a different sense.

The case of actual full "possession" of an individual by an astral entity is supposed to be relatively rare (according to Seth, for instance). The above example of the entrance at the back of the skull by the Dark forces would be a degree of this. In the case of the severe examples of possession which occur repeatedly for no apparent reason, the reasons are hidden. The victim will have had strong affiliations in one way or another with the entity in past lives, or "worked hard" to invite the association.

PARANORMAL SOURCES

Psychic abilities arise in the opening or freeing of certain chakras, such as the "third eye" in the forehead, giving vision beyond physical sight. Also, sometimes an injury may open up a chakra giving sudden paranormal abilities. However, psychic abilities are also aided or provided by astral entities - often ones good natured and interested in experiencing through the host the results of these abilities and, in particular, ego satisfaction.

The example of the well-known Soviet woman - the most thoroughly scientifically tested case of psychokinetic ability - has been stated (channelled information) to be due to an entity association. Various light objects can be moved around a table top without physical contact under the most rigorous testing procedures. Considerable stress is experienced by the psychic, heart rate becomes very rapid, and fatigue ensues. The entity (not, of course, recognized by the scientific teams or presumably by the woman), is said to step down (transform) the vibrations of the mind - the lower frequencies of the brain being too weak for psychokinesis - to match those of the matter of the objects, thus enabling force to be transmitted.

In addition to the above-mentioned negative thoughts which cause astral entities to tune in, mere emphasis on self or selfish acts will attract them. Why? The structure of the ego self is of low frequency - it exists in the 3D spectrum of energies of greater separateness of energies, similar to negative entities.

As we move up the scale into higher frequencies and greater dimensions the unity and span of consciousness increases.

Hilarion's book *Dark Robes, dark Brothers* is an excellent source of information on the negative forces.

THE PURPOSES OF THE DARK FORCES

Thus negative astral entities, by tuning into or becoming attached to humans, in addition to generally being destructive by creating and exaggerating problems or even "aiding" man's materialistic inclinations and psychic abilities, will hold him back, preventing development of consciousness. The more effort a person makes to rise to greater heights of consciousness or spiritual attainment the more resistance or attacks the astral entities will generate, desperate not to lose their human contact through his ascension to higher-frequency states, which they cannot endure.

As mentioned, their "hold" over man is provided by 1) man's past bad experiences and harmful acts, creating memory areas in the subconscious which are compatible to the entities, or simply that the entities of these past events are still present, and 2) through man's obsessive thought forms and general negative thinking but also 3) by the need of these negative entities to suppress an activity or person to prevent any type of development which could be disadvantageous to them, whether technological or spiritual.

The victim - a writer, healer or research scientist, etc. - may be protected by the guardians of the spiritual hierarchy. On the other hand, he may not be protected, where the resistance from the entities serves a necessary purpose to provide karma for this individual. He still has subconscious negative areas to work out and the astral entities associating with this negativity will provide karma for the individual and an opportunity for him to clear it up. Or, where the contribution being made is unappreciated and out of time, and not within the reality of others (for, example, original research), with the possibility of foreseen disadvantages arising, such as supplying man with energy sources he could misuse, the subject could also be stopped. The astral entities would welcome any opportunity to control man

and would not have the foresight of the enlightened beings to realize that such "allowances" are positive in the long-run, but in any case they are more concerned for their immediate needs.

OVERSHADOWING OF THE SPIRITUAL HIERARCHY

All we are stating is that negative forces are often allowed to interfere with man, 1) to provide karma, 2) to stop say a particular development for which man may not be ready, and also 3) to be bargained with by the Light Brothers. Let us continue with this theme.

The entities have limited energy and have to consider an economical distribution of it at all times. For example, a new-age author, writing a book with a view to disseminating some revelatory information, or a person with some goal in any way counter to the entities' purposes, but where either have possibilities of being stopped or delayed, where this may serve a purpose (as given above), would be affected firstly by direct hindrance to the individual; for example, causing tiredness or lack of enthusiasm for the project. This failing, further efforts can be made requiring more energy such as influencing the minds or bodies of others where such persons interact with the victim in regard to the project. As a further stage, still more energy can be brought to bear by influencing events in space and time such that out-of-phasesness, or wrong timing, occurs, or bad luck is experienced, etc. If the negative forces are fully determined to stop the intention, a further step requiring greater energies would be to bring about a delay in the progress of the project so that special attention could be given by them to develop techniques to finally thwart the success of the goal. If the latter is resorted to they will probably always succeed unless the spiritual hierarchy has other plans in which case the Dark forces' efforts can be overridden, if this is within the Creator's plans. So we see that the relationships involved can be quite complex and confusing.

We see that behind these negative actions from the Dark forces, there is usually positive regulation by the spiritual hierarchy. Before dealing with this aspect let us briefly mention another method by which energy is

used by the Dark Brothers to suppress man, which may be permitted by the guardians. This is given in Hilarion's book.

Energy from the collective source of these negative astral beings is moulded into a robotic form of a Dark entity which has given rise to the name "Gremlins." These robots, relative to our conception of a robot, would be considered living things, but with no free will except that governed by any complex programming they are given. Such creatures are then sent out to hinder positive people or even interfere with machinery! After the dark deeds, the energy forms are then retrieved, and energy absorbed back into the Dark Brothers.

Sometimes there are examples of karma experience which also involve the obvious karma of another, and one may wonder if one had any responsibility for the other person's misfortune. For example, an important project is stopped as a result of an unexpected and significantly untimely death. Here again the negative forces can regulate event sequences or events in time. In this case, the deceased was a victim of unfortuitous circumstances but his death would have been imminent and was brought forward in time (or vice versa, had already been delayed) by the Dark Brothers to coincide with the project. The extent to which incidents are untimely, or coincidences occur, has only to be observed, but, in general, the Dark forces are amplifying existing negative energy and operating on an individual's own past-created negative acts, and they require instruments such as people through which to communicate.

The Dark Brothers have developed a technique to create a shield to protect them from the high-frequency radiance of the Light Brothers. And this is necessary, as explained in Hilarion's book. Meetings are sometimes convened between the Dark and the Light beings. The Dark Brothers may make a request to project negative energy into a human's experience. The guardians will decide whether the final result of this will be constructive - that the affected individual will overcome the set-back and receive subsequent benefits. If the request is accepted then a deal is made in which the Dark ones must agree to a withdrawal of negative

influences from other areas in which individuals are not responding constructively.

The shielding technique of the Dark Brothers gives them protection throughout most of the astral plane which could be regarded as divided into subastral (vibrations low and similar to Earth's), lower astral and upper astral plane. However, because of the dangers to the unwary more positively oriented beings their freedom has been restricted by higher legislature.

THE DESTRUCTIVE EGO

The term ego arose within the development of academic psychology, along with other named states of mind such as superego and id, etc. We have covered the fundamental states of the mind and all we need to present here is the basic multidimensional consciousness or superconsciousness, and its lower self and three-dimensional aspect, the ego of this material universe.

As we have already implied, there is much confusion on what exactly is the ego, which would be expected to arise since the inner nature of consciousness is not recognized by orthodox science and psychology. In addition, varied opinions arise as to what exactly it is supposed to refer. In other words, its definition tends to vary. As mentioned in Chapter 3, we shall refer to a natural ego and its extended ego or ego structures.

THE NATURE OF SELFISHNESS

Now one cannot entirely isolate the ego and hold it responsible for all impulses to commit selfish acts. It is not a self-contained entity but totally structured within the conscious and subconscious minds and dependent on energy from the superconsciousness. However, regarding this responsibility, the conscious individual, over aeons, has exhibited a conduct in which each original aberrated impulse or inclination was agreed upon and was at that time within the being's control. These aberrations build up, creating more unconsciously-stored data giving rise to a constant interchange between aberrated behavior and selfishness, and the various ego characteristics, each reinforcing the other. Subconscious impulses then have an enforced effect on the conscious mind and the personality, which the "I" cannot control except in suppressing the expres-

sion of the impulses - and great discipline and will power may be necessary.

Consequently, as we have implied, selfishness is not normal but emphatically abnormal. The natural state of consciousness, free from all extended ego structures, cannot help but be other viewpoints, minds, identities, or experience a natural empathy for anything; it is incapable of being selfish, except by aberrating its own structures. Selfishness is not a conscious phenomenon.

Before man had formed a separate soul but was existing with a lower-self consciousness in a body (see Chapter 11) he was incapable of thinking selfishly. Automatically he put the group before himself. We are merely indicating that it is all a question of the state of consciousness. The ego viewpoint, particularly in the religious approach, only attempts to deal with the effect end of the cause-and-effect cycle. Thus this ego viewpoint in religious teachings does not handle or even theorize about the causes of ego problems but merely advocates control and discipline over the aberrations (and help from Christ), not recognizing that they are blocks in awareness and that consciousness needs to be freed and expanded in these areas (although easier said than done).

That is, the person's behavior is governed by: 1) presence of aberrated impulses which when reactivated causes dramatization of these impulses, which he allows to happen (seemingly cannot stop). This is enforced "bad" from the subconscious mind. Secondly, 2) he has the same aberrated impulses (as above) but suppresses them through discipline and enforced control. This is enforced "good" from the conscious mind - the out-of-phase waves are still there but the individual does not incur further aberration and out-of-phase energies by expressing the bad impulses and doing harm to others. The spiritual harm inflicted by suppression of self is negligible compared with the karma incurred from the extroversion of these bad acts. Thirdly, 3) the ideal case, in which the person's consciousness is in tune with its source or soul; no - or little - walled-off areas in the mind, ability to experience the expanded (non-ego) self and project into the environment and other sources of consciousness. This is true freedom.

In these lower worlds in which quite naturally the egos have free rein, the mechanism is that action or behavior can be separated from the mind's contents. For example, the person has an aberrated structure in the mind which is restimulated but he denies it expression. This is because the mind is made separate from the universe at the 3D level by exphasizing physical senses which do not operate on resonance and in-phaseness of waves. This objectifies the universe relative to man's viewpoint forming a separate "out-there" world which to the ego is the visible world, and also forming an invisible world within the mind which is regarded as subjective.

However, in the higher worlds of absence of ego, in which visible and invisible worlds become one, this aberrated structure is not hidden, either to be expressed or not expressed. It becomes, more, part of the existing energies of the environment and energies of others. These higher realms are not objective as are all Earth-type worlds. In the aberrated case, such a person could not live at this level; his vibrations would be too low and he would not only be unable to perceive, but existence in these higher vibrations would be painful. However, between lives if the discrepancies are not too great, benefits of experience at such a higher level can occur and can be allowed, but all faults are totally visible and form part of the person's "body."

HUMAN RELATIONSHIPS

Let us cover some of the weaknesses of the ego, and the problems it creates in human relationships.

The ego contains such enormous protective mechanisms that even if the subject in question has a brilliant intelligence and apparent awareness, the ego mechanism can render him blind as a bat to certain elements of his own behavior. Obvious traits of an undesirable nature can be amazingly justified by the ego by filtering the information through an extended ego reality structure, causing the self to experience a different reality. A person obsessed with something, good or bad, depending on the subject, does not realize other people (unobsessed in the area) do not share the reality.

The most common malady of the ego is in the give-and-take relationship of people. The ego view will present to the overall conscious mind that it has a fairly balanced give-and-take situation with another, that is, fifty-fifty relation, when in truth it could be ten-ninety ratio - gives ten percent, takes ninety percent. The ego is always biased towards self. It really notices when it gives, and doesn't forget these incidents, but may accept the "takes" without a moment's thought and forgets them. It has no ability to confront another's viewpoint as its own viewpoint, unless it totally agrees. To correct this, a person should either become fully aware of this, which may not at all be possible, or allow for it and give more than he appears to take, thus coming closer to the balance point.

The ego's main concern is self survival. Countless aspects of life can threaten this survival and it develops all kinds of neuroses, in particular, insecurity. A particularly strong ego will feel disturbed by, say, even a friend in some temporary or permanent gainful aspect of life, but vice versa experiences relief when the other is losing. Even knowledge not understood, or superior knowledge may threaten the ego, particularly that of the intellectual. All kinds of strange and illogical motivations will arise from this ego to defend itself - actions not remotely relevant to the subject or expected behavior in question.

Validation is a necessary source of "fuel" for the ego. It may need constant support to keep it going, and may have developed an ego structure which translates appropriate self-actions of any kind, even if in error, into praiseworthy ones, to sustain its self-aggrandizement. This prevents the person from perceiving his own errors. There is an automatic computation which puts in a favorable bias on his viewpoint, regarding his own actions, which does not operate when observing others.

However, there are certain limited advantages from this. Constant validation will tend to increase the positive abilities. But in the long run the person has to confront what he is doing.

The ego is so "ingenious" that it can even hide its own lies from itself. It can do this because there is so much of the mind not being confronted and so many layers or justifications built up. It will believe anything it wishes to believe and, within material limits, make it true, attracting all "like" data and remaining unaware of "unlike" data. In fact, a kind of double-ego layer can develop. Just as in the original formation of the ego (see Chapter 17), in which consciousness separates from its own action (sees its environment as objective, denying responsibility for its creation), it may as a further state separate expressed intention from the action it represents. For example, the behavior "all talk and no action," or even failure to keep promises, agreements, etc., in the sense that the person sub-consciously actually feels as though the actions have been fulfilled by voicing the intention, are typical instances.

The above characteristics of the ego will also tend to manifest overconfidence. This is a cover-up of inner insecurity, an actual non-confront or blocking off of any reaction to failure. The ego can be stunned or shattered if it suddenly has to come face to face with its own behavior. Deflation is its enemy and it forever seeks inflation.

It hates being wrong. It will often risk death rather than be made wrong. This is a key factor to take into account in human relationships in avoiding where possible making another wrong unnecessarily. However, many people have a certain sensitivity towards the effect of invalidating others and caution is exercised, but neglected in heated moments.

A basic drive of the ego is that it needs to create effects - even in the natural ego state free from aberration. This does not exclude children who must have praise, assurance and validation of their actions. They must feel wanted and consider that they have worth and are a source of causation - not just an effect. If a child's existence has no acknowledgement the ego will get attention by creating bad effects since it found that good effects were ignored. And sure enough the child now finds he receives much attention; he can actually make things happen around him by these

acts, really proving to himself that he is a creative source of energy and not just a robot to respond only to instruction. (The creative source is actually the soul but the ego needs, and often demands the credit.)

Thus this is an example whereby the ego-need to create effects is so strong that whether the effect is good or bad is of secondary concern! This trait, in an augmented state, will create the vandal and then the criminal. The above same requirement of reassurance of the ego also applies to the adult. Remember, the **natural** ego requires this, not only the aberrated one. It must establish individuality and build a good self-image but one can see how crazy it can become.

Now another more extraordinary manifestation of the ego is one in which it includes others in its own viewpoint for **self** action in an area, but retains the self-viewpoint only. Let us explain the fundamentals of this.

Basically, all consciousness possesses unity and it is, in its primary state, everywhere at once (**All That Is**, is one God with all energies in tune and in phase). This cannot be changed. However, superimposed on this are more individualized regions, and finally the separateness of the egos. This means that the more the ego strengthens itself and becomes separate, blocking off any unity, the more this unity must act unconsciously since it cannot be destroyed. Thus enforced separateness of the ego causes enforced (unconscious) unity (discussed in **Superhuman** under the two principles of separateness and unity).

Now the true healthy state would be conscious perception of the unity and being aware of the ego as self within this, either operating as self (ego) only, or uniting consciousness (collective) with another in any particular communication. However, in this example we are citing, instead of the ego recognizing self and its boundaries, it includes the other person(s) into itself (consciousness), not as a unity or collective state (which would be correct and sane) but as a **self** state. The ego has expanded out to include others within its ego boundaries, like an enlarged self but not the collective self, and not realizing in this subconscious motivation that the others are separate individuals.

You may have guessed the result. The expression "friends are there to help" is misused and they (the friends) are, in fact, imposed upon in a manner almost as though the owner of this ego is doing them the favor. The "give and take" goes haywire. Such persons fail in all lasting relationships. When they are happy they cannot understand why anyone else is not! The problem being stressed is that such a state is incapable of the realizations owing to the separated and out-of-phase energies. They cannot be told.

The above, even in very small doses, results in "taking things for granted." This will also wreck a relationship. The individual automatically assumes that certain actions are acceptable to the other person. It is assumed that their reality is the same. Everyone has enormously different reality structures, but they are invisible. Everyone appears to see the same environment and appears to comprehend what others are doing and why, but the invisible motivations occasionally show, indicating, in fact, drastic differences in these thought structures.

The ego illusion of apparently being separate from the environment also tends to support only outward material realities of the visible universe, attaching all value to this with little value on inner characteristics of integrity, honesty, ethics and principles. The ego fails utterly to recognize that the learning process in life is spiritual. The correct situation is one in which it often does not matter what the outcome of material effort is, whether failing or succeeding, but what does matter is the spiritual reaction to the material happenings.

Anyone who cheats is totally exposed in the "invisible" world ("heaven"). The energy structures formed are visible in the real worlds. In fact, since our consciousness is present at the other levels up to the soul then all mind states of man even when in the physical worlds are visible and known by other beings in these planes.

As a final point, the ego cannot handle good or true communication. It operates 3D-wise and thus essentially is aware of sending communication to another observing only physical reactions or effects on the other, and receiving communication via the effect words

(only) have on his mind with intellectual duplication. Good communication is higher dimensional and involves instantaneous elements of communication simultaneously with the 3D verbal effects. The higher components involve some conscious or intuitive duplication of the other's viewpoint by contacting and feeling that reality.

Even if the context of the communication is superficial the higher components of communication or perception would result in no interruption - and high duplication of the other person's reality both during speaking and listening. Each would become the other's mind or consciousness in the particular reality being expressed with all its ramifications not expressed verbally. Flow of communication from one to the other would be smooth since each would know when the other wished to say something or make a brief comment in the subject to be continued.

CHAPTER 6

KARMA, OR "GOD WORKS IN MYSTERIOUS WAYS"

Man, unfamiliar with the nature of the law of karma, will interpret it as punishment, or will sometimes account for it with the statement "God works in mysterious ways." Karma means action, and as a cause-and-effect law it is applicable to space and time universes, in particular, the lower more material worlds, where the positive and negative forces within vibrations are well separated, giving rise to unchanging objective time. Cause and effect has sequence (it needs time), which cannot be changed (in objective time). (However, karma of a higher order, in which space and time as we know it is non-existent, would be expected to apply on the higher levels.) The law applies to good or bad actions, and works in such a manner that whatever effects are caused - good or bad - the equivalent effect will return. This is an exact equation. However, we shall mainly be concerned with the negative consequences of karma.

Superficially, it can be interpreted as punishment from God, but this would represent a low level of truth and not be worthy of man's intelligence. The Infinite creates the karmic law of which the energies involved contain the unity of both automaticity and personal monitoring; another non-comprehensible property at the 3D level. That is, if science were advanced sufficiently, it would extract the mechanistic aspects of this law and prove the exact science of it in discovering the energies involved - and then probably deny the possible presence of a Deity since they had the mechanistic explanation. Conversely Western religion would extract the beingness aspect and imagine God watching over man, making judgements on his behavior and carrying

out actions, without thought to (God's) energy principles.

The Infinite operates constructively at all times otherwise it would not be all-knowing or a perfect whole. The karmic principle was introduced to save beings from spiritual devolution. In order to protect God's subjects it was decreed that all their negativity could be resolved by expressing it outwards. For example, man's mind reflects outwards into the 3D material worlds - within his environment and physical body as an effect on himself. Thus man would experience his own negativity giving him an opportunity to recognize it and rectify it. Without the principle of karma man would have stored up so much negativity it would have destroyed him by now, even as a spiritual being.

The above-mentioned principle of simultaneous automaticity and creativity is used continually by man himself, at different levels, for example, in skills, and this is achieved by means of the holographic (higher-dimensional) mechanism, covered in **Superhuman** and **The Hidden Variables of Plano Technique and the Fundamentals of Skill**. Note that this is a non-ego type mechanism in which there are learning patterns within learning patterns - consciousness within consciousness - and this holographic method is the only way such abilities can operate. This is a general principle which we encounter intermittently throughout the book; life is not linear (ego view), but hierarchical (consciousness within consciousness in a holographic manner).

Thus karma is a self-regulating principle in which the automaticity operates at our level, which restores sanity, or a (holographic) balance and resonance of the Infinite's original energies. Remember though these energies are not separate from consciousness, and beingness is behind the energy principles. This concept may be found unbelievable at some levels of application. For example, there is such an entity as a transformer being (**The Urantia Book** material) which has the sole job of transforming energies and controlling currents in certain sectors or energy levels of the universe. These energies are obeying definite laws but the laws are "living." Such a being has high intelligence and could be

communicated to, but is designed especially for that particular work and does not have much of a scale of evolution, if any. Note that this is an example of this same principle of simultaneous automaticity and personal monitoring.

MECHANICS OF KARMA

Let us now briefly consider the actual mechanics involved in karma. An individual carries out a harmful action on another. Such an action has no counterpart in the Infinite's energies or the soul's positive energies. It is a destructive effect either by action or omission. The basic energies of the Infinite are all harmonically tuned; discomfort, pain, etc., are expressed as out-of-phase energies (otherwise there would be no pain, etc.). The victim will thus have an out-of-phase energy (effect-type) pattern of the experience. The perpetrator will also have a recording of this experience in his own mind which is out of phase (with his own energies, cosmic and God's energies, since he cannot have a bad intention unless there is already some out of phaseness which causes his lack of perception of other's experience).

As a result of this the karmic law will take effect. To remedy the disharmonious energies which were created by causation and an outflow, he must now be the effect and receive a reverse flow. Such flows will mainly be fourth to third dimensional. In experiencing this reverse flow, cancellation of the misaligned wave phenomenon occurs. This would be due to the fact that one flow is the mirror image of the other and the sum thus forms the unity of these positive and negative opposites (see Chapters 18, 19 and 20).

Remember that these energy waves are very complex and in great quantity. It could take a continuous trickle of negative experience for sometime to erase the negativity or it could be counteracted with a more powerful healing force more quickly. In the case of the victim, the need by him to cancel his out-of-phase energy patterns will tend to cause him to commit a similar act to the one done to him, but, in general, he would resist this and in any case his negative patterns are due to an effect state (not the cause), and recordings would be in a lower level of the mind and

could more easily be healed by conscious alignment of the area. He will nevertheless have had other experiences in which he was the perpetrator, and these would have to be handled.

A good action on another is always one which increases unity and harmony (see Chapter 21). When this occurs it means energies are brought into phase to a greater degree - which regenerates an energy pattern higher dimensionally, adding to the gradual spiritual integration of the individual with consequent benefits.

Karma would be relatively negligible without the existence of many past lives. Man's present predicament could never have arisen without a great accumulation of negativity both individually and collectively. World circumstances today are worse than the average person is likely to believe. Even matter has increased in density and become more three dimensional with reduced frequency of space and matter as a result of lowered consciousness (see later chapters and appendices).

We can now see the reasons for the apparent injustices of life. Underlying these reactions are various hidden factors such as: the problem may have causes which originated millions of years ago; the karmic rebound may be from merely one incident or the accumulation of a great many similar incidents; the criminal and moral implication may vary enormously (of these hidden pasts); the soul will vary the degree of karma which is set for the person in any one life. And in addition to all this a highly ethical person will experience a rapid rebound, even from a minor indiscretion or irresponsibility which seemingly leaves another of lesser integrity unscathed for maybe a lifetime or so. However, the unethical individual or even the criminal will encounter his respective karma when and if he comes up to the corresponding level of consciousness which recognizes these bad acts, even if there is a delay of a million years. Thus a bad action may have an immediate and severe rebound or it may be delayed by many lifetimes until the individuals come up to a realization of their actions.

ORDERS OF KARMA

There are different orders of karma as described in Hilarion's material. For example, a person, A, shoots another, B, through the chest in a past life. In a following lifetime A is similarly shot. This is a first-order karma of A.

In a later life, A suffers chest ailments. This is second-order karma. In yet another life A comes into contact with B - normally neither knowing of their past negative interaction and affiliation - and B has chest problems. In this life A helps B who may well be in the same family. This is third-order karma. Finally, fourth-order karma is a more positive aspect of human interaction in which A helps his fellow man, in general (even if as an unconscious compensation for his past deed). As a part in the whole (collective consciousness) he is taking some responsibility in this fourth-order karma for misdeeds within the human race, or to put it another way, on the basis of the whole within the part, he is taking responsibility as collective consciousness for the actions of collective consciousness.

A much concerned question by many humans, and also one which here serves the purpose of revealing an interesting point, is that of whether man incurs karma through killing animals for meat. A study of relevant information indicates that the answer is not straightforward. However, we are proposing here that within the lower spectrum it is natural for animal-man to be carnivorous just as are many animals, but from a higher level it is wrong, and man operating more at this level will incur karma. Different dimensional levels have different laws which can appear to contradict one another. It all depends where one is consciousness-wise.

KARMA CHOICE

Generally, karma, no matter how severe, is not specifically enforced for any particular life but is agreed upon by the soul and arranged to be experienced by the lower self to be, in the next incarnation before the particular life. The amount of karma to overcome, and therefore preset before the life will vary considerably from one individual to another for any one life.

This is governed by the number of lives already experienced, the spiritual level attained and how much the lower self can confront and wishes to, in one life.

One may find it hard to believe that the tragedies of life, severe and agonizing illnesses and injuries, even effects on the planet and Sun - storms earthquakes, volcanoes, sun spots and flares - are related to karma. How could a soul **choose** to go through inevitable agony in a lifetime? The more pertinent question is how could it be worth it?

The answer is that the existence at the soul level makes the material world existences insignificant in comparison. The Earth lives are a mere speck in time and every benefit attained at this material level in overcoming karma has inestimable value at the soul level, "repairing" out-of-phase energies, clearing blocks and allowing progress of the soul. This cannot be imagined at man's level who is immersed in the all-importance of his material dramatizations and problems.

Some of the interactions of help from advanced beings may be partially karmic to them (their overcoming) and of a higher order, although some may actually volunteer to absorb **other's** karma in rare cases. But more common is apparently the Sun's action of absorbing some of the karma of planet Earth owing to the severe negative thought forms surrounding the planet.

Thus a drastic physical encounter may be arranged for man's karma even to bring about an "invisible" (to the humans) spiritual change, seemingly small and insignificant to man, but in fact having far-reaching implications and repercussions on the higher levels. For example, a well-integrated soul, still incarnating, projects a lower self into a family group and pre-arranges to die of an incurable disease at the age of a few years, knowingly putting the parents through agony and temporarily causing them complete mystery and doubt about life and God. They would all always have agreed to this at the soul level, but now their lower selves have a chance to delve into or dwell on explanations about life and such tragedies, and give more attention to the spiritual side of existence, thus bringing about certain desired effects in removing

blocks to progress - created in previous lives - which could not be handled at the soul level. The gain from this - depending on the positivity of the parents - could be immeasurable for the soul.

Basically the spiritual being has free choice (not always the lower self - see chapter on freewill), even to the extent of choosing to go to the fearful and corrupt (Hell) worlds of the subastral planes if that is their level (see final chapter).

We are not going to delve into human problems and solutions but as a final point we can see something here of the difficulty in trying to cure or handle some problems. Basically any problem is constructive since it is an expression of a negative state which already exists, and presents an opportunity by its extroversion to be handled. Thus from a higher level a "problem" is not a problem, only the time it takes to solve it, or work it out. This "time" can be anything from a momentary cognition to a lifetime of experiencing misadventure (running out karma). But even within this range one cannot apply a general rule. Some problems were generated at the lower levels and can be cured at the lower levels. Other problems may require a much broader change in the person (such as reduction in ego) before a particular problem will disappear. The latter would have been preset from a higher level, to be solved at the lower level. Some problems thus cannot be cured by others, such as with psychic healing. Such problems are higher-dimensional and too much an overall part of the personality to be handled specifically (all problems, however, basically require aid from the person's own mind and soul).

THE IMPRISONED EGO

The civilization of planet Earth must possess viewpoints of unsurpassed diversification. It cannot at all be assumed that a correspondingly progressive civilization of another world, even with similar history, would be segregated in its people's viewpoints, such as religious and educational, and also in beliefs, in general, and sanity, etc., to the degree that Earth civilization is. We are stressing differences due to self-created reality structures. This is the ego in all its negative and positive aspects when it relates to disharmony.

In a nutshell, the relationship between our society's singular minds, is generally one of disparity, great separation and lack of unity, or, in other words, lack of harmonic attunement amongst these separate consciousness' forming the collective human state.

THE EGO REBOUND

The nature of this state and its causes will be handled more in later chapters but essentially we have a society or world of beings in which survival for self is dominant, and mainly comprising the ego; a state considered quite normal and acceptable. And this, on the one hand, is purposive but on the other, man is supposed to evolve out of it. Existence has become one of survival of the fittest, the necessity to acquire physical possessions and build up the security of the insecure ego, and actions for self-gain are justified.

In general, however, and on a large scale such three-dimensional existences on Earth-type worlds such as ours are karmic and constructive in all the apparent senseless catastrophes, tragedies and destructive

elements in general. Thus physical universes comprise karmic worlds in which man works out his problems.

To continue existence in these lower worlds will become a trap, if it is not already for many people. The happy person with a "good" life, wealth, career, family, etc., cannot continue with such lives indefinitely. Extended ego structures will inevitably begin to develop with all their dependence, needs and materialistic effect-type happiness. Many experiences will have to reverse to balance up the life vibrations coming from the fourth dimension of the unity of the opposites (see Chapters 18, 19 and 20). Karma will build up and the soul will impose more preset programs on the lower self to prevent his or her undesirable deviation of consciousness in further lives.

All this material given on the ego nature is essentially directing us to the important aspect that if the ego is allowed to run rampant as a sole identity, it will prevent evolution of consciousness. The rich will find that in a future life they are poor, the powerful will encounter enforced humility, and the successful will fail to the degree that actions and purposes are for self only and to a further degree that any harm or loss to others is caused in the process. Note that the reverse does not always apply. A poor person does not necessarily become rich since the "poor" state is not an ego-positive state and cannot easily be misused. Remember that the effects of this mechanism have **nothing** to do with the physical expression or action (such as being rich - assuming no harm done). It is governed purely by the individual's spiritual reactions and attitudes to these actions and experiences.

As we shall see later (Chapter 20), it is eventually necessary to live and behave more at the equilibrium point of life's vibrations which swing from positive to negative. This is sometimes expressed as "moderation in all things." The lower self will often protest such sermon-like maxims as this - quite understandably when reasons are not given, and that a deviation from moderation might be found highly preferable (although only in the short run). We shall come to realize throughout the book the scientific principles of the

Infinite which give the truth behind such vague statements.

THE EGO'S FINAL CHOICE

Why cannot one act only for self; this is fully in keeping with the law of self-survival? Or more to the point, why is there a kick-back? The reason is that man is a spiritual being of enormous potential and he cannot continue to exist on the lower planes other than to relearn the elements of misdirected lives and cancel out his karma - restoring the harmony of energies within the soul. If he does continue, by emphasizing materialistic behavior - negativity can only increase.

The ego self state is a 3D structure which enables self to be separate from others and the environment by providing an **external objective** world (the structures are governed by physical states which do not operate on in-phase energies or resonance as with the soul and the Infinite). Constant reinforcement of this state from many lives, with inevitable extended ego-structure development must result in more out-of-phase energies forming within the lower-self mind or psychic anatomy. From this point, man can only go downscale. His ethics, integrity, honesty, responsibility - all constructs of the invisible world (spiritual) - will decline. The lower he becomes the more difficult it is to come up. Eventually his frequencies are too low even to reincarnate in a physical body and he will become a negative astral entity (see Chapters 4 and 19).

THE ILLUSION

The ego viewpoint creates tremendous illusion. One person's circumstances cannot be compared in the "visible" world of ego behavior with another's. It is utterly pointless to complain that others are more fortunate or less deserving, and that life is unfair. There can even be double layers of illusion here! The first layer is that each person has experienced and caused all the reasons for his or her predicament, probably extending back to past lives, and furthermore, the negativity they are experiencing is spiritually constructive. Thus there are two parts to this illusion, 1) man is not experiencing an injustice and 2) the

negative experience is potentially constructive. This is the first illusion with two parts (1) and (2).

The next layer of illusion is best illustrated by an example. Consider person A, and person B; both have a strong drive to become millionaires in their respective present lives. Person A succeeds, B fails. The success of A may be totally positive in that his soul had preset this as a high probability to handle certain spiritual aspects which could arise from this wealthy state. However, as another valid possibility, the success may not be positive, and this is the example we are taking for the purpose of demonstrating the illusion. The individual A may have a very strong ego built up over lifetimes and one that is now supported by many astral entities of similar personality, with compulsive and ego traits. Contrary to what may be best for this individual A, and in spite of significant guidance from his soul not to be rich in this life (until the ego structure is annulled), the overall power of his self plus reinforcements from negatively biased entities enables him to "succeed" in becoming a millionaire! Thus it is actually not a positive experience since he now simply strengthens his aberrations in this area and the positive and negative balance within unity is displaced further (see Chapter 18).

Now the opposite condition applies to B. He has not actually failed! His soul's purpose was carried out which was not to be rich until, say, he has learned humility, to cancel ego states developed in previous lives by misuse of his wealthy status. We see that there is no point in B comparing his situation with that of A, unnecessarily invalidating himself for "failure" when in fact he is the one on a more constructive path.

The summary of this is that a person's successes or failures in the materialistic worlds, such as in the above example, have equal merit spiritually in the sense that they are only being experienced to correct spiritual reactions to experience - to rid one of compulsions, ego needs and aberration.

As we have seen, and as we shall see later more specifically, and even technically in the appendix for the scientifically-minded, the ego traps one into the lower planes. A vicious circle is set up whereby the

more the ego succeeds in its self gains, power, etc., the more tuned it becomes to lower frequencies with gradual devolution, and with the opposite conditions incurred, either as latent or experienced karma.

EGO ENTRAPMENT THROUGH KNOWLEDGE

Brainwashed and indoctrinated restricted viewpoints or false concepts stifle man's evolutionary progress. Science and religion are the most powerful areas of knowledge for this suppression. Science considers all causes to originate in the 3D framework, and at the other extreme, religions consider causes come from some unknowable "beyond" and from God. Both subjects diverge the more these assumptions are "verified."

In their existing format these viewpoints are irreconcilable, giving little hope of any agreement let alone a basic unification. Both bodies of knowledge overlap, however, at the ego level of illusion. Now when we come to an application of this cause-and-effect knowledge of both viewpoints using perception and intellectual thought, science is consistent in that its 3D theories are compatible with the ego viewpoint and, of course, are based on a limited reality consistent with the ego which created the science. Christianity, however, has self-contained contradictions; faith in Divine causation (a truth) contradicts the ego framework.

Religions are attempting to interpret truth with the naive everyday logic of ego perception, in particular, by the concept of total separateness of identities in 3D space, and separation of God, instead of on a hierarchical, or consciousness within consciousness basis. Man is responsible for his condition, but God can override this responsibility in his infiniteness. Thus there must be **withinness** and not **separateness**.

High level truth is almost totally destroyed with the extremely limited viewpoint of the ego, and one is left with a lower level linear framework which cannot even remotely handle such higher level concepts as the Jesus/Christ/God relationship, the nature of the higher worlds, "the Kingdom of God is within," the dichotomies positive and negative, right and wrong, God/Satan, etc.

As implied above an **unfortunate** feature of this ego-linear viewpoint is not only its state of no responsibility for others, but in religions it also takes no responsibility for the lower self, not recognizing the subtle and intelligent relationship of responsibility of self (which includes the soul) and God's role.

Imagine for a moment such an ego viewpoint making judgment on the advanced concept of a star being a consciousness or a living being! This notion can easily be understood, however, from the nature of energy and the evolution of the atom, as described in this book (mainly the appendix).

Unfortunately, the ego control in religion, is not only as strong as it is in the established scientific fields but is less intelligent, and has consolidated its concepts on man, life and God on an illusion - the inadequate basis of the ego, with its **falsely delineated** boundaries of consciousness.

As already mentioned the ego gives us the linear view of existence: a singularity of perception, of particles, of separateness, a surface view with no depth into unified layers of consciousness (higher levels in the hierarchy). There is no depth perception higher-dimensionally (at right angles to 3D). By linear we mean perceiving one thing (particle) at a time in 3D space or time with items strung out in space or time - no underlying unified layers of experience. However, depth perception is occurring to some degree all the time within consciousness. For example, linear experience of the arts involves no appreciation. In listening to music there is no actual music in the linear ego experience - which is of mere disconnected sound. Depth perception into greater unity, frequency and dimensions must occur for musical recognition (which is not within the 3D spectrum).

It is vitally important that this egotistical viewpoint, if not understood, at least be subdued to a level of humility. Ironically it is a viewpoint which is supported vehemently by the negative forces regarding both religion and science.

Now whereas religion starts with no comprehension of, but complete faith in, God - basically a high truth and ideal - and then degrades this concept by bringing it

down to the ego level to provide egotistical and apparently complete answers, physics, contrary to this, starts with an ego understanding of the 3D universe, using classical physics, which at this level is partially workable, then finds that observations at the atomic or micro level reveal a different world not amenable to conventional (ego view) science theories.

In this, science is looking beyond the simple world of physical senses and seeking greater truth in its interpretations, in particular, with the implication of quantum mechanics, which defies the naive logic of the ego but is far more successful in explaining reality than is classical physics.

Thus science starts with the ego view then goes beyond it creating great confusion within itself - not recognizing that it is encountering a higher and larger framework, whereas religion starts with and acknowledges God, and moves in the opposite direction with its linear ego "analysis."

Fundamentally, then, religion expresses the highest truth in its faith in God, then denigrates this by establishing sacred truths at the material ego level of comprehension; whereas science expresses the material level using ego perception and observation and is now breaking through the ego-particle view of reality, but meeting seemingly insurmountable problems in encountering higher dimensions of energy.

Now endless religious arguments occur because of the ego's naive three-dimensional viewpoint of basically multidimensional concepts involved in Jesus' teachings or any knowledge of causes of life and the nature of spirit and God. A hypothetical, simple analogy highlights this case of diversity of religious viewpoint: one ego states that Earth is a place with trees - the data and experience of this is correct. Another viewpoint is that it is a place with oceans, etc., also found to be correct. However, the ego manifests its true limitations, and its egotistical weaknesses are revealed when these two viewpoints are compared. The discrepancies are immediately obvious and will remain irreconcilable in their present form unless the ego backs down and lets consciousness expand its horizons.

The condemnation of atheists or agnostics or those whose interpretations conflict with orthodox religion but present greater truths, in other words, the "inquisition" and the "burning at the stake" is still being perpetrated.

Science invalidates the occult since the latter's operating basis is outside the frequency spectrum of 3D physics, and Christianity condemns the occult, assigning it totally to Satan's work and failing to recognize that it is higher knowledge, which may be used or misused. What one makes of it, or how one reacts to it, is totally within the creativity and choice of the individual.

In the extreme examples of religious zeal, these egotistical views are so negative and destructive they are a disgrace to the teachings of Jesus Christ; a perfected being who volunteered prior to his birth to endure the traumatic experience of the crucifixion with Christ at the side of Jesus, the man, symbolizing and exteriorizing man's negativity and taking responsibility by absorbing some of the race's karma. Such religious righteousness will have to be balanced with full retribution, binding those concerned still more to the lower planes.

Throughout most of this book we are endeavoring to reveal - not from another ego viewpoint - that the egotistical viewpoint is not just a fleeting, whimsical or unsubstantial and undesirable state which can be changed simply by mild effort (such as suppressing conceitedness) but is one based on a concrete identity of three-dimensionally indoctrinated consciousness requiring a break down and restructuring in its limited concepts; concepts with a destructiveness amplified out of all proportion, if validated, propounded and disseminated in the name of God.

CHAPTER 8

THE AFTER-DEATH EXPERIENCE

There is considerable information on the nature of experience beyond death, which is no longer debatable - merely an education of the evidence. Such data experience is brought to us by a variety of sources: persons having died physically and returned to life, mediumistic messages from those passed on, ancient knowledge, prenatal recall, out-of-body experiences and transmissions from spiritual sources.

The consciousness of the lower self leaves the body but the body contains life within the cells for some minutes. The entity leaving contains the conscious mind, but the subconscious is disconnected to give a clean slate - an apparently contrived procedure. The superconsciousness or higher self is always there in the higher dimensions.

The key factor which determines where beings will go is their frequency level and reality concepts. This is not something which can be changed in any immediate way. It is the result of a great many years of the person's learning, unlearning and spiritual reactions to life's events.

We can use three categories for describing these after-life experiences, 1) those of beings which are of a negative nature as a result of selfish or criminal acts in previous lives, or young beings solely perpetuating ego-type existence, 2) those of moderate classification exhibiting average behavior or development, and 3) of spiritually mature souls who are close to transcending material existence.

NEGATIVE EXPERIENCES

In the first category we have persons whose lower self is generating lower frequencies and considerable

misaligned energies of consciousness. In the chapter on reincarnation, although in attempting to reconcile the conflicting evidence regarding the validity of reincarnation we proposed that the lower self is different each time since it is projected from the relative vastness of the soul, there is evidence to indicate that some lower selves will almost immediately return to physical life, when it is too soon - this is never a good thing and is not conducive to maximum progress for the individual.

The entirety of the lower self's vibrations are of a lower materialistic nature and the person has no concept of the spiritual or aesthetic state of higher existence with no integration of this lower self on the higher-energy levels. For this individual, once they are out of the body and alert, their first reaction causes a frequency attunement to concepts of returning to a body. Sufficient past life or soul knowledge is available to enable them to find a maternity ward but high preference would be given, frequency-wise, to opportunities involving relatives. An expectant mother of which the deceased has some (past caused) attunement would be sought and chosen if the unborn child had not already been claimed by another being.

A more severe example in this negative category would be that of a being whose lives have given him a criminal reality and whose spectrum of vibrations is such that he finds himself in dimensions in keeping with his creations - a corrupt environment of similarly oriented beings. This type will also wish to return to a body, unless needing a temporary escape, but he may not be allowed to by the guardians of the hierarchy, and he may have to experience a suitable internment at his own level, but with prospects of rehabilitation, involving reincarnation or temporary return and union with his soul, before reincarnation (these latter aspects involve some speculation).

A still more drastic example is one in which the criminal degradation of the individual is so severe that there is no hope of the lower self uniting with the soul, and, in addition, reincarnation is not possible. The vibrations of this lower self can no longer be tuned to its soul or higher self and also are too low even to take

on another normal body - unless there was an extreme sub-species or mutant which provided a vehicle of compatible frequencies. (Note, however, that not all beings associated with a subhuman form would be criminal - at least in that life - and some would choose this, depending on their problems - in preference to a more normal or developed body - to atone or become humble and subservient to raise its vibrations.)

As described by Hilarion, this example is tragic since it not only means its soul is weakened by the loss of a part - and too many losses would put the soul into a different category - but the lower self is then fair game for the Dark forces. These astral entities of the negative regions will robotize the being and program the lower self, salvaging his upper frequencies to reincarnate again. A group of the Dark forces would now have direct control of the lower-self mind, brain and body thus giving them a powerful foothold in the Earth-type worlds for their misdeeds.

ENCOUNTERS OF THE AVERAGE INDIVIDUAL

Experience of category (2) would be more applicable to the average person and would comprise the majority. Most, leaving their body at death, experience confusion. They have no information about what to expect and may even have denied the notion of continuous existence. In the latter case this would probably result in unconsciousness for some time but the being would be placed in the care of guides, etc., until such suitable time for their recovery and initiation into their new environment. Otherwise, the confused being, will be helped immediately regarding his adjustment and what is expected of him, etc.

In many instances the individual has unreal concepts which are incompatible with even the flexibility of the new dimensions. They cannot easily be helped - they are not receptive to truth and information from the guides. They may even regard anything less than Christ or God, or their concept of angels as demons. In such cases, the guides may create a temporary compatible environment, such as for the Christian, the gates of heaven, or in other cases, a materialistic environment in order to break the reality of the atheist gently. In any

event, the purpose is to re-educate the being into after-physical death experience and aid him or her in every way possible.

In some situations the lower self will not realize or believe he or she is physically dead and will still cling to the material environment before being released from the tie. This could give rise to cases of unpleasant hauntings but which would usually relate to some aberration or traumatic incident prior to or causing death. The poltergeist is out of time and stuck in this recorded event of intense emotional charge. A more severe example of this type is one in which some traumatic accident has shocked the spirit out of the astral shell, leaving this astral entity or body to wander aimlessly in an environment to which future hauntings will be associated.

At some stage in the between-lives phase the being will re-unite with the soul. This is ideal since the spiritual gains and losses of the previous life can be recorded in the soul body and further plans made for a further reincarnation. All problems will be manifested in the vibrations of the soul as out-of-phase energies with reduced vibrations, etc., and it is thus necessary that these are projected into the physical environment of a lower self to experience and cancel them.

All souls have freewill and can choose whether or not to reincarnate. **But** they will probably always make the decision to reincarnate as this is the only way distortions in the soul can be remedied, and development of the soul becomes all important. The soul is not alone. Even the most loved or popular person on Earth is lonely compared with any soul. Thus aid or available knowledge is instantaneous from other souls who only wish for what is best overall.

The between lives phase may be anything up to several hundred years in duration - every case is different regarding both problems to overcome and choices of procedure.

Many individuals will have the opportunity to visit the solar system planets, Venus, Mars, etc. However, these structures will be spiritual counterparts to the physical planets, just as man has higher bodies. These particular visitations to the planets are preceded by a

disconnection from the more familiar environment of other spirits, etc., and a sensation of floating in a high frequency ethereal realm is experienced. This more fluidic state gives the person an experience of oneness with the Infinite and is accompanied by a temporary loss of ego or self experience.

One may then find oneself within the environ of any of the planets of various vibrational qualities - peaceful, angry, antagonistic, lofty, etc. They all have particular learning purposes which relate to man's characteristics and problems.

These experiences occur within the spiritual counterparts of the planets in our solar system. That is, all planetary bodies contain other dimensions for possible life which are not perceivable by the ego from any particular material plane, such as Earthlings attempting to view other kingdoms or civilizations in Earth's other dimensions. Some of these planetary planes will be in the astral dimensions and available for spiritual experience and learning after physical death.

For example, Mars with its war-waging frequencies may be visited by individuals needing these frictional frequencies as a stimulant, or the reverse, to experience their reflection of their own antagonistic traits thus giving them an opportunity to recognize this and change the condition.

The planet Uranus will amplify resentment that a person has harbored and still is harboring from the recent life or other past lives. Each person has choice about visiting these planets and can withdraw at any time if the experience is not confrontable, but generally all problems have to be handled at some time.

Jupiter is for the unbalanced ego characteristics. On this planet everyone feels like a king - manifesting an exaggerated ego - but is virtually ignored, and attracts no special attention, producing ego deflation, leading to essential changes for spiritual gain.

Mercury has the frequency for ridding a person of material desires - tempting, inviting and indulging them with the lessons, but providing no satisfaction. The frequencies of Venus are gentle and peaceful, communicating great harmony, to such a degree that many of average development cannot endure it since it brings to

the surface the person's own inner discordances. Planet Neptune conveys a deceptive "well-done" feeling but nothing ensues. The individual is left waiting for it all to happen until he recognizes his own inactiveness and has to make things happen, make decisions, etc.

Pluto encourages a period of re-evaluation and demands all thoughts to be centered around union with God; anything less than this results in instant removal of the person. Finally, Saturn - not for the novice - is for spiritual uplift and the ultimate testing of the soul.

ADVANCED ROUTES

In our third classification we have the more spiritually mature person ranging up to the perfected being. Now one of the remarkable characteristics, or even quirks, regarding a difference between the non-material and material worlds is that the type of learning which must occur in the material lives to overcome difficulties **must** take place in the **physical** worlds.

Realization **between** lives involves energy relationships which do not solve much at the 3D level, except that they can preset conditions which can then be catalyzed at the physical level. Thus a developed being should be in the process of conceptually recognizing his greater self and true identity as a soul as he nears the end of his particular karmic cycle. Every gain which is made at the 3D level in grasping concepts relating to higher consciousness is invaluable and essential to real progress.

After a number of physical lives involving good progress, the individual will have the opportunity between lives to visit a place, sometimes called "Summerland." The being still has a few or many aspects of material existence to clear up - in particular, he has many incomplete cycles, including the positive goals he never achieved and on which he is still hung up. Summerland is a dimension whereby a being's thoughts materialize instantly. If he wishes he can take a past-life series of incidents and relive them - not in thought but with real structures. He can change any of the details or whole events as he chooses. All persons involved in the re-enactment are living thought forms and will play their parts realistically and obediently.

His attention, however, may be on the future. He may, for some time, have had a nagging compulsion to be a great civil engineer. In Summerland he can fulfill this goal and see his engineering designs come to fruition; bridges, dams, etc.

This sojourn in Summerland is for as long as it takes to work out these material needs, and could entail a span of years. At the completion, the individual may decide that further incarnations of his particular cycle of lives are not necessary. On the other hand, further material-world experience may be decided upon and the knowledge gained - even as the civil engineer - could be utilized, resulting possibly in the actual physical experience as a civil engineer.

Many opportunities for self-examination arise between lives and, in particular, this occasion is encouraged towards the end of the cycle of lives or especially at the end.

Developed beings who have completed their lives may take it upon themselves to reincarnate with the sole purpose of teaching their fellow men the meaning of life, and they become a spiritual leader, a guru, a philosopher, or even an avatar. Others may actually choose a different reality system - a physical, or psychological existence which may or may not involve reincarnation into a body. There are infinite possibilities: universes of totally different structures, for example, musical universes, mathematical universes, etc. But the being is not likely to stray too far since unfamiliar and maybe totally different formats of consciousness could undermine the soul's integration and progress.

There is yet a different route which fits none of the previous classifications. This apparently applies to, or can be tailored to fit all persons, criminals average people or advanced alike. It is an after-death experience involving made-to-measure steps of evolution from physical to spiritual. This route is an organized procedure administered by the spiritual hierarchy responsible for the writing of the Urantia Book (mentioned in other chapters). There is no reincarnation via this path to enlightenment - merely one physical life per person.

The personality leaving the body is taken to the Morontia worlds. These worlds are associated with or overshadow this particular sector or system of the galaxy called Satania. The Satania system is monitored and ruled by the headquarters planet Jerusem - an architectural world or sphere made to order. Around the sphere are seven planets of transition culture and around each of these, seven satellites orbit. These seven mansion worlds have been called heaven.

All these worlds are architectural, meaning made to order or deliberately contrived, and the whole purpose is to give man organized steps for transition from the material realm to the spiritual. This plane referred to as Morontia appears to be of a type other than any astral plane. Astral energies are non-atomic but in Morontia the materials are a working combination of physical vibrations and spiritual, achieved by the Morontia Power Supervisors - beings specially created for this function.

One hundred physical elements of our universe are combined with one hundred elements of Morontia material of unique energy organization. In the scriptures, Paul refers to this substance as being in heaven and as "better and more enduring" than the physical elements.

The ratio of combinations within this material can be varied and a total of 570 Morontia bodies are available, graded for successive transitions to spiritual levels. Even plant life and all existence on these worlds is graded for spiritual advancement. This ascension of man through Morontia and beyond is described in the chapter on the higher-dimensional worlds.

VIBRATIONS

Since vibration is the basis of everything except the highest and original state of the (unmanifest) unqualified Absolute (see Chapter 17), it is desirable that the layman grasps the more simple aspects of this concept giving then a better opportunity to understand consciousness, the creation of the physical universe, and almost every feature dealt with in this book. Although there will be some oversimplification, which is necessary, the simplified technical aspects will be difficult for the layman (and additional concepts difficult for the professional) and he is only expected to read or study this chapter to the degree of his need to understand vibrations.

WHAT ARE VIBRATIONS?

Vibration describes something which oscillates from one energy state to another and back again with continuous repetition. Drop a pebble into water and waves will be created which oscillate (vibrate) up and down from crests to troughs; the air around the diaphragm of a speaker is oscillating from compressions to rarifications; a spring, when set in vibration, will oscillate from one state of tension to the oppositely directed tension; electromagnetic waves, which comprise any radiation, are vibrating from an electrical positive to an electrical negative, etc.

The principle is that, from an initial state of balance and stability (before oscillation is created) a displacement is produced to create an imbalance - positive or negative as opposed to neutral. This imbalance constantly tries to attain equilibrium. Overall, there is reproducibility and stability but within this stability there is instability.

Thus in the vibration there is constant motion yet there is overall stability and consistency for potential control over the wave for its uses.

TYPES OF VIBRATIONS AND THEIR NATURE

There are two main categories of vibrations: 1) those which move from one point to another (through three-dimensional space or matter) and 2) those which prevent motions of itself by being played against itself as an opposite; or the opposite wave is provided by another wave of the same vibration. All vibrations are energy. Figure 3(a) and (b) illustrates (1) and (2) above respectively. We shall come back to these figures.

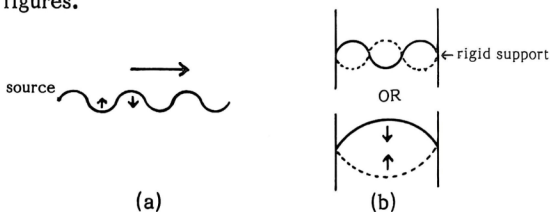

Figure 3

Now all such waves of this oscillatory nature have a wavelength. This is the length of the wave from one point to the next identical point; for example, regarding waves on water, the wavelength is the distance between a point on, say, one crest to the corresponding point on the next wave (AA or BB, etc. in Figure 4).

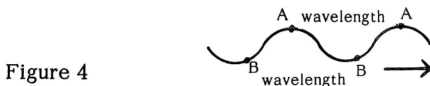

Figure 4

Now vibration describes the oscillatory nature of waves, and rate of vibration is frequency. Frequency is the number of wave lengths passing a point per unit time. The phrase higher vibrations relates to vibrations of greater frequency. Note that waves are not always moving, such as those stationary ones which make up an atom, and frequency is the number of repetitions per unit time.

The first type of vibration mentioned above - shown in Figure 3 - although it can be more easily seen as a vibrating wire (for example, violin string), waves on water, or skipping rope, also must be visualized as applying to electromagnetic radiation or waves since this is what we are usually talking about when we refer to vibrations. Thus Figure 3(a) covers all radiation. And all radiation, from light to heat to radio waves, etc., is electromagnetic, which is named thus because it has an electric and a magnetic component (perpendicular to each other).

In reality, propagation of the electromagnetic wave occurs basically from a central vibratory point and expands outwards - see Figure 5. The oscillation spreads out its waves to "dilute" its intensity over a wider area (for example, such as water waves) or greater volume of space (for example, electromagnetic waves). Thus it radiates through space seeking equilibrium - a lower potential.

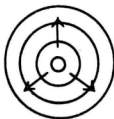

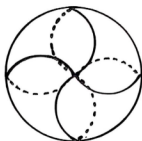

Figure 5

The second type of wave sequence, one which is prevented from moving across space, is the basis of all structures. See Figure 3(b) for a simple representation of this. This diagram simply shows a wave being reflected back and forth between two surfaces illustrating containment of the wave.

Now more relevant to the formation of universe structures and reality, and as a simple introduction to the nature of these fundamental structures, imagine type (1) again, Figure 3(a), in which the waves are propagating concentrically outwards from the source - Figure 5. If hypothetically we now envision a spherical barrier being placed around the expanding wave which reflects the waves back towards the source, then (for a particular size of the sphere in relationship to the wavelength) the reflection will produce an ingoing identical wave which balances the outgoing wave produ-

cing what in physics are called **standing waves** or **stationary states**, and we now have type (2), Figure 3(b), vibration, represented by Figure 6.

Figure 6

This configuration demonstrates the structure of a simple atom - an explosive wave (positive) balanced by an identical implosive wave (negative) producing a **stationary structure**. This is the method used by the Creator for the creation of physical universes.

In the above example, the **rigid sphere** is necessary to produce the opposite flow because the configuration is only three dimensional, and it is not possible to create the configuration in 3D without it. In reality, the situation is much more profound and not understood in official science (see appendix). Very simply here we can say that one opposite energy flow, as waves, comes from the fourth dimension, gradually "curving" into our 3D space, spiralling into the center (Figure 7) and the other flow comes out of the center (which actually comes from another 3D to 4D space "inside" or beyond the central point from a corresponding, antigravity universe; this needs a great deal of practice in visualization to grasp - see appendix).

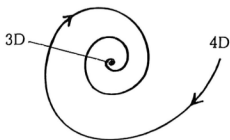

Figure 7

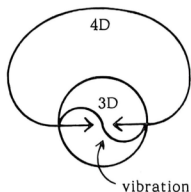

Figure 8

Thus in these energies, configurations or stationary states, no rigid support is required (such as the sphere), partly because both flows, the explosive and the

implosive, or positive and negative, come from the **same source** in the **fourth dimension**; a little like the pattern in Figure 8. Remember that no diagrams can handle 4D configurations.

It is important for the reader to obtain some understanding of all this because basically this is about **all there is!** These spherical standing wave structures form all matter, which have particular frequencies (relatively low compared with those of the mind and space), and waves also move out from these standing-wave structures. Space is filled with these same type of vibrations, some propagating across 3D space, some standing; vibrating in and out. However, in space, frequencies are greater and our physical perceptions do not react to them. Also, science can only detect a small fraction of the oscillations in space. Note that the rate of vibration for standing waves is given by the number of times the oscillation goes back and forth per unit time.

THE VORTEX

Now the above simple energy configuration representing an atom is called a **vortex** - it is actually spiralling in and spiralling out. Hypothetically, imagine a whirlpool spinning in towards its center then out again continually. This is a 2D picture, whereas the atom is 3D to 4D.

This is the fundamental vortex. In the micro range it forms atoms and therefore all matter. Electrons are associated with the ingoing spiral, and protons the outgoing spiral. The same type of vortex, only larger, forms a planet. This vortex is harmonically tuned to the atomic vortices (and those in space) and sustains the atoms of the planet (the planet vortex is a little higher dimensionally though). This frequency and above have not been directly detected or even considered in established science.

Moreover, the planet vortex is linked to the larger Sun vortex, the Sun vortex to the galaxy vortex, and this, and therefore all the others, linked to one universe vortex. Each frequency is greater towards the universe vortex, and strictly each lower frequency is **within** the higher one(s) - Figure 9 refers.

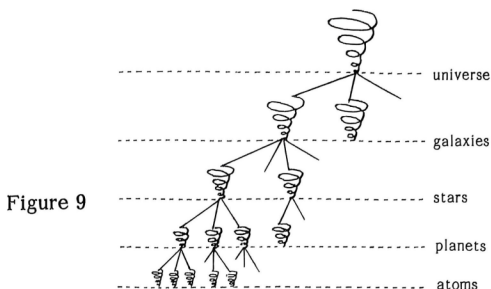

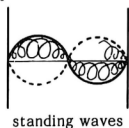

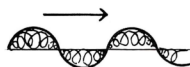

Figure 9

We can see that science only deals with the 3D level of atoms and that strictly this level is only a very partial and superficial view of the universe. The whole of space is filled with the spectrum of these energies and their interactions and may be called cosmic energies.

Both types of vibrations, those which are "standing" or balanced, Figure 10(a), such as of an atom or those which are propagating through space, Figure 10(b), are effectively moving across space and spiralling into it simultaneously, and thus such a wave is a travelling vortex.

(a)

(b)

Figure 10

We see then that all structures are made up of standing waves (in the form of vortices); waves which are endeavoring to propagate but are counterbalanced by their own kind. Therefore all matter is under continuous creation from moment to moment. If the energy or waves coming into an atom to create it were stopped in the higher dimensions, the atom would disappear; similarly if the soul stopped the continuous flow of energy into the human body, the body would disappear, and correspondingly the whole universe.

To avoid any confusion for the layman reader with a smattering of knowledge on physics we should add that most of the information in this chapter is not (yet) part of established science.

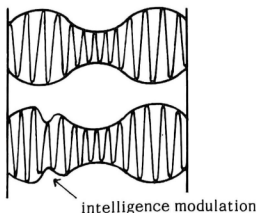

INTELLIGENCE

The type of configuration shown in Figure 9 of vortices within vortices with increasing degrees of unity towards the one universe vortex apply to all structured phenomena. The mind or energies of consciousness work on the same principles. Life is expressed in the form of vibrations (see chapter on the Light).

Now intelligence is due to the pattern impressed on the wave. This intelligence may be basically programmed into the universe or creatures, such as that to seed a universe or that pattern which enables a spider to weave its web, or it may be created anew, in new patterns on the waves.

This is how information is conveyed from one place to another. Radio and television waves have a carrier wave upon which is modulated information or intelligence. See Figure 11 in which the higher frequency wave is modulated (adjusted in amplitude in this example) to produce electromagnetic fluctuations of positive and negative potential.

Figure 11

The character of the wave is now varying in both amplitude (height) and in time. All experience can be represented in this manner (in more complex and higher-dimensional waves), just as the television waveband carries electrical signal intensities proportional to light intensities from the scene to be transmitted, which can be translated back into light and reproduced on the receiver screen.

DISHARMONY

Consider again the simple harmonic electromagnetic oscillation which is pictured in its most simple form in Figure 3(b). If a random force is regenerated in that area the wave will be unbalanced. If the vibration is that of a living cell which contains specific information on its waves or within its oscillation it will be disturbed regarding its function. For example an injury to the cell or cell energy configurations due to a cut, burn, bullet wounds, etc. disrupts the pattern of oscillations or any particular wave balance. It invalidates its intelligence with a persisting disruptive effect on the wave forms. The existing patterns of intelligence controlling the cells' functions now have superimposed patterns causing interference - partial cancellation, amplification, new variations of electromagnetic effects, etc. - see Figure 12.

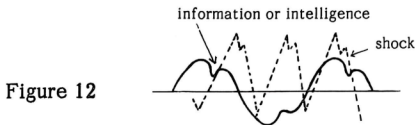

Figure 12

The cell not only fails in its function but the disharmony it has incurred places it out of phase with the rest of the organism. The mathematical harmony of oscillations within oscillations (increasing unity from the part to the whole) does not balance out (holographically). This injured part is not resonating with the other parts and the whole. Pain, both physical and mental, is due simply to this disharmony within oscillations or waves. This disharmony of different kinds applies to all disease, injury, neurosis, insanity, general problems, conflict, etc. If all physical parts of an organism such as the human body are tuned to the whole - and therefore to all other parts - no disease or problem can exist at that physical level, and it would also mean that no areas of the mind which relate to corresponding body areas or expressions are disharmonious (but there can, however, always be **latent** problems owing to past-life incidents not in reactivation).

Another disharmonious or out-of-phase manifestation in the wave is where we have waves within waves in which information in one wave acts as a sync pulse on the wave within it, such as needed in a cyclic or repetitive condition. For example, a cell has basic information which is repeated over and over, particular chemical processes (information on waves) in the body require precise and relevant signals for their activity, coordination involves frequency and sometimes continuous return of a limb position or posture, and in fact every muscle which is switching in and out in complex muscular movements (as in even the simplest movement) requires synchronization pulses.

An extremely simple man-made electronic example is the spot on the television screen (compare wave containing information), which is within the syncing pulses at the end of each line on the screen which brings back the spot, all of which is within the syncing pulse occurring at the bottom of the screen, returning the spot to the top to repeat.

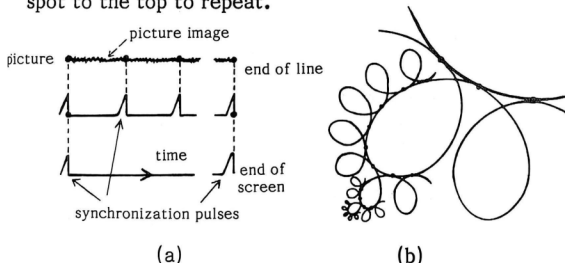

Figure 13

This is illustrated in Figure 13(a). All three separate lines of pulses must be exactly synchronized. This synchronization is similar to the one in Figure 13(b) showing a more elaborate mind circuit or pattern comprising vortices (waves) within vortices (waves) containing information on the waves (not shown), with the many connecting points or syncing regions; for example, a simple movement of the hand, wrist and arm, in changing directions involves countless muscle fibers,

some tensing continuously during the movement, others switching in and out exactly according to requirements.

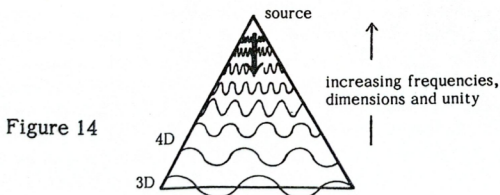

Thus disharmony of wave forms, the basic expression of all man's ills, arises from interference from incompatible energies created from sources which are out of phase with the Infinite's energies and which then superimpose these waveforms, oscillations on harmonious ones causing combinations of out-of-phase patterns, off-balance wave oscillations and, with complex patterns, non-synchronous pulses and disorganization.

THE LIGHT

One hears constant reference to the "Light" in connection with the spirit or God; for instance, God is Light, In the beginning there was Light, Messengers of Light, the pure white Light of the Christ, etc.

THE NATURE OF LIGHT

Light is the most fundamental active energy ingredient. Visible light is, of course, one minute part of this vast infinite spectrum of Light which extends into infinitely higher frequencies through the higher worlds to the one source. Light is energy, luminosity, and manifests in a vibratory manner to the observer's perception. The radiance increases as we go up the scale of vibration and is visible to a consciousness expanded and in tune with those levels of consciousness, since Light is consciousness - see Figure 14.

In the material dimensions, consciousness does not perceive directly (the light or consciousness), but is restricted and channelled by physical senses which step down its frequencies and give the appearance that these physical senses are perceiving. In a way, man is completely blind, in general perception, but he has marvellous physical robot-like mechanisms for contacting his environment. Physical senses are mechanisms

which cause a reaction when, for example, a particular band of light frequencies enters the eyes. Consciousness free of these senses, could perceive light more directly by interactions amongst the vibrations of all consciousness.

Even physicists are now referring more and more to photons of light being emitted and absorbed by and exchanged between all substances. (A photon is the smallest unit of electromagnetic energy - contains an electric and magnetic component). Light, which is electromagnetic energy, is the basis of all creation and in itself can only be "good" but can be used or misused by beings. If it is misused then it will be reduced in frequency and cause isolated out-of-phase regions. As a natural protection, the unity (power) and span reduces. It appears to be a non-personal pure vibratory essence from the unqualified Absolute out of which, forms or personalities are created ranging from a living cell to The Trinity. Light is energy which is moulded by any level of beingness with freewill. It is the carrier medium for manifesting projection of the unmanifest Infinite qualities of the impersonal Absolute.

Between the fourth and third dimensions most of the Light energy appears unmanifested but is simply invisible and undetectable to scientific measurement as a sea of what physicists call virtual energies. However, by tuning into these energies they can be kindled, regenerated and brought into material existence as particles, three-dimensionally polarized waves and atoms etc. That is, within the 3D plane the essential basic Light energies - of the planet, the Sun, etc. - are actually manifest, but beyond physical perception. Nevertheless various polarizations of energy can be set up (a linking together) within these basic Light (electromagnetic) energies bringing their use into 3D by means of interconnecting energies brought into manifestation or kindled through these polarizations, such as in psychotronics or the paranormal

THE HARDWARE AND SOFTWARE OF THE INFINITE

Now it appears that Light is not ultimately the fundamental state. It is the most basic **manifest** energy for creation but is expressing the unqualified Absolute

of **unmanifest**, pure qualitative infinite potential. This state is non-personal but discovers Itself in vibratory forms and stationary states of Light structures. On this basis even God or The Trinity will be an integrated Light structure forming an identity and personalization of infinite magnitude from these Light energies.

What this amounts to is that, in itself, **manifest** vibratory Light is sheer mechanism and electronic if considered without its constantly-associated **unmanifest** ingredient of the unqualified Absolute. Light enables all structures to be formed, visible or invisible to man, from a spider to God. The only difference between an insect and a Supreme Being is that the light structure for the Supreme Being is infinitely more complex and refined. But both contain the same **unmanifest** energy of the unqualified Absolute with a thought format which causes this **unmanifest** energy to utilize and mould appropriate Light vibrations. This appears to be what the Tibetan Eckankar masters call the Eck energy (or the Sugmad). Remember that by Light we are referring to the basic vibratory energy from which all things are created by means of standing-wave structures as described in Chapter 9 on vibrations.

UNQUALIFIED ABSOLUTE: THE ORIGIN OF LIGHT

Thus the unqualified Absolute can structure Itself, as expressed in a personalized or qualified state of God. That is, it produces a qualified **manifest** state - a personalized God - within an unqualified **unmanifest** state. Also, lower beings down to humans can by means of thought and **considerations** set a mould or blueprint which acts as a program or set of instructions within this Absolute. This attracts appropriate Light energy for materialization of the thought pattern (whether visible or invisible to physical senses). Below man's consciousness, such as in that of an animal's mind, the influence would be slight, as in changes of the animal's learning or behavior patterns, formation of memory and general recordings.

The Light structures, then, are not only formative in shaping forms and creating identities from the balanced waves of the standing-wave oscillations but all other information is contained as modulations within

these waves. Every single item which is expressed is represented mechanistically (electronically) in the vibrational patterns (see chapter on vibrations). Thus a hypothetical and infinite science would discover that all living organisms or spiritual beings are like electronic mechanisms in all ways except for the unmanifest unqualified Absolute which was within all from which the Light stems and from which anything could be materialized by means of this Light.

Thus these living Light structures of creatures, man, mind, spirit, Supreme Being, can mould the energy if capable of independent thought. Instinct, a particular format of Light energy, is already programmed and executed in a rote manner. We can see that even reality structures within man's mind are configured out of Light interactions forming stationary states for the structuring and programming of information. His beliefs are his basic thoughts and considerations which act as the mould for what the unmanifest Absolute will create from Light vibrations.

When a thought is created or program changed, at a relatively low consciousness, such as at man's ego level, the vibrational content of this change oscillates throughout the spectrum and does not exist solely on the low level - God knows every thought! The vibrations which carry it already originate up the scale and within the personal God or Infinite, and the information itself is recorded within the impersonal Light, and the unmanifest state may have to be continually expressed at the lower level to align the energies.

It is vitally important that man realizes that his whole existence, predicament, problems and environmental circumstances exist only because they are being created by the unqualified Absolute in accordance with man's reality. For example, if a man firmly does not believe in UFOs, this state of mind even amongst trillions of other states within him, is like a rigid distinct format which the impersonal energy duplicates as an overall experience spanning space and time, thus preventing all those vibrations and structures from entering his environment which do not match up - it may be in the form of evidence from documents, people in general, contactees or actual sightings.

In finalizing this chapter a brief digression, relevant to the above, into karma would be that man creates his own reality and that there are actually even no victims! Being a victim is playing a particular role in accordance with reality creation and is a way of working something out.

EVOLUTION AND MAN'S TRUE ORIGIN

Darwinism only dealt with evolution of material organic forms, whereas the complete picture is one in which we must consider both physical evolution and spiritual transformations and integration. Darwin's theory is even less than half correct. Man did not evolve from lower species nor did lower distinct species evolve from one to other higher forms in the broad sense of the theory. One should think more in terms of each specific species as evolving "vertically" within its own framework of evolution and not "horizontally" from one type of creature to another.

Now we have a very different situation with consciousness or spiritual integration. But not only do we have to consider both the physical evolution and the spiritual integration but also the interaction between the two.

COLLECTIVE CONSCIOUSNESS

Spiritual "evolution" firstly involved seemingly a devolution in the sense that consciousness descended into material forms. It started with collective consciousness. This was given the purpose of separating into many souls, each then to develop independently - learning by interaction on lower levels.

Thus we have 1) the physical evolution involving gradual integration of cellular organisms from atoms and single cells, and 2(a) quantitative spiritual segregation; division of collective consciousness into separate parts, with the possibility of devolution spiritually, also 2(b) qualitative spiritual integration in which independent souls re-establish contact with their origin.

In addition, we have to consider interaction of organic matter, (1) above, and spirit, 2(a) and 2(b) above. One can see now why the subject has not been made clear. The quantitative separation of spirit and its qualitative integration are not separated from the physical changes.

Firstly, collective consciousness can be thought of as a massive volume of spirit which was given some initial qualitative independent characteristics by the Infinite, different from other species of consciousness. We can now think of this large fragment of consciousness as dividing into approximately two halves: one forms the human life-stream to associate with the material worlds, and the other, the life-stream of beings to be specially formed and of limited evolution, for continuous operation in the higher worlds - called angels - with the purpose of providing the continuous spiritual counterpart to humans, for guidance in the more negative existence of Earth lives, and eventually and ultimately reunion in the New Age.

This is not so dissimilar to the action of man focusing his consciousness (compare human life-stream) into an area, almost hypnotically, but leaving part of his attention (the angels) observing himself and thus able to pull him out of a trapped hypnotic condition (dramatization of materialism).

According to Hilarion's material this collective consciousness of the human life-stream was originally associated with lower integrated physical forms such as the air kingdom, mountain ranges, plants, and apparently even the dinosaurs, etc., all involving valid experience for this consciousness.

In the development of physical organisms, although they have their own associated consciousness they have no significant identity or individuality. These lower consciousness' or psychic anatomies evolve and link up between lives with expanding regions of consciousness as they reincarnate into higher physical forms. Thus this type of consciousness is building up and resonating with higher levels more and more, compared with man's spirit which, as we shall see, comes down scale in its association with the physical levels. Primitive man

comes into this lower animal category. Man, today, did not evolve from Stone Age man.

Now initially this human collective state was distributed into superhuman type bodies of a more astral type (which were provided). The spiritual level was still only collective though. These bodies were of lighter structure, as "astral" implies, than present-day more dense bodies, and were also androgenous or hermaphroditic. That is, they possessed a high degree of unity - above three dimensional - in which positive and negative, or the male/female genders were not yet expressed or separated out. (Note that it is not strictly correct to say that the androgenous unity or body contained both female and male properties, as this is like defining, say, a solid sphere as made up of two hemispherical halves or two extremely complex shaped halves. It would be a non-sensical explanation - the male and female are merely inherent as a particular possibility.)

THE TEMPTATION

The next major event was the Temptation. Man, with his secure androgenous body, had not sufficient weaknesses or insecurity to respond appropriately to the Temptation plan or program. Thus at this point the body was divided into male and female bodies. Remember that the androgenous energy body would be of higher frequency and not visible to us in our present, and it did not entail anything too miraculous or preposterous to crystallize two, more-physical forms.

Thus in addition to presenting a body form of greater vulnerability, the existence of the sexes encouraged greater division for consciousness (in support of the original purpose - that of creation of individual souls). Note that this process of division apparently occurred over a period of hundreds of thousands of years as more of the race volunteered for division (Hilarion's material).

ADAM AND EVE

These were now the Adams and Eves (there were also other series according to The Urantia Book) and they lived in pairs in perfect harmony. (Note that the

Bible's metaphorical statement of Eve's creation from Adam's rib implies a nonsymmetrical split!)

The subtle procedures introduced by the Temptation are evident as we observe that all factors are constructively involved with the Creator's plan for mankind - every negative facet anticipated and given a constructive path. This extraordinary intertwining of negatives and positives in which both deliberation and spontaneity are permitted, in which action and reaction or error are allowed, gives a hint to man of the workings of the Infinite, in which the dichotomies of freewill and preset organization of events or parts, integrates greater Beingness within the One.

In the Hilarion material it is explained that it took another race of superior beings (also mentioned in the Bible), along with a number of powerful overshadowing spirits to provide the conditions of the Temptation. Lucifer, a brilliant and beautiful celestial being volunteered to provide the negative influence which was to encourage interbreeding amongst the different races.

Note the incomprehensible aspects to man's present intellect, of an angelic being, Lucifer (a positive), volunteering to attempt disruption of the Adams and Eves' harmony (negative action). In his success (a negative), since the other race had independent souls, offspring from the interunions also had independent souls (a positive), and a further step of the Creator's goal was achieved.

According to The Urantia Book the Temptation was quite different but it is probably referring to a completely different period, one much more recent and of the order of thirty to forty-thousand years ago. However, it does refer to their description of Adam and Eve as being of the third physical series. In this context Eve was swayed by Caligastia, the Planetary Prince of Urantia (Earth), whose concepts clashed with the Divine plan for planet Earth. In turn, and to avoid losing Eve, Adam compromised his integrity and went along with the plot. Satan was Lucifer's first assistant who was in league with Caligastia but the latter is referred to as the "devil" and a deposed Planetary Prince of Urantia. (There is no reference to the more popularly known aspects of the Temptation.)

To continue with the Urantia material, Adam and Eve were created over eight-feet tall and divided from their original androgenous unity specially for their Earth mission. They were given the rulership in a strife-torn world. The task was particularly arduous and discouraging as a result of the effects of the earlier Lucifer rebellion which is described in detail in The Urantia Book, and relates to Lucifer's criticism of the entire plan of universe administration, although he initially retained apparent loyalty to the Supreme Rulers. He questioned the validity of the Universal Father and maintained that physical gravity and space-energy were inherent in the universe. He did not recognize that personality was a gift from God.

Lucifer claimed that far too much time was spent on training ascending mortals (see chapters on reincarnation and Heaven), and that the destiny was pure fiction. He advocated self-assertion and the liberty of individual self-determination. This over-emphasis of self was seemingly the seed of the rebellion.

LUCIFER

The Urantia Book, similarly to other sources, describes Lucifer as a magnificent being, a brilliant personality and a perfect "created Son" of the local universe. The disastrous results of his instigation of the earlier rebellion are dealt with, expressing fully the seriousness and subsequent penalty, but with no hint that such a plan was within the constructive foresight of the Infinite, or accommodated by It, but that, in fact, the origin of Lucifer's turning away from the Light was unknown and one for speculation!

We mentioned earlier that Lucifer volunteered to play the role of mischief maker. This level of creativity and decision is very high on the hierarchical scale of consciousness and unity, and Lucifer's offer to play the "devil" would be analogous to writing a play then taking part in it on a lower level in which the lower level is a true reality - just as do human souls for the lives of the lower selves.

The crimes enacted in the "plays" must be handled as actual and are subject to strict laws at this level - all consequences and karmic dispensations must be

experienced. Since existence is subject to laws within any dimension but that there are different laws for different planes or dimensions, the manner by which Lucifer achieved this double role was to create a "reflection" of himself and setting this counterpart to do the evil work. Thus the original Lucifer was acting constructively on a very high level (somewhat similar to the higher constructive (positive) action of a catastrophe caused by the Creator to benefit man in the long run). He produced a negative polarity of himself which when eventually played out, or resolved out of the negativity, would unite with himself and would make him greater, but the karma would have to be administered and experienced.

According to The Urantia Book, Lucifer, which we can assume means his negative counterpart, is still on one of the seven detention satellites orbiting one of the seven planets orbiting the headquarters sphere, Jerusem - all architectural bodies, made to order (see chapter on Heaven).

It may be apt here to mention that Earth could be labelled a prison planet - which might, however, be taken as an insult by many of its inhabitants. Purging of the galaxy of the many sources of the Dark forces have resulted in deliberate and enforced incarcerations on Earth of many fallen angels, particularly some of those from Maldek. Maldek was a planet in our system originally prepared for fallen angels to work out their karma. However, they failed, became more negative, and the planet was destroyed (the remaining massive negative thought forms were attached to Mars to avoid over-contamination of Earth, and the planet debris forms the asteroid belt, one of the unexplained mysteries of our solar system, between Mars and Jupiter).

As a result of all the negativity to which the human life-stream has been subjected - in addition to that justified by man's own acts - such as the above, and the enforced negativity applied to encourage formation of selves or independent souls, man, at opportune periods, is allowed relief from some of the karma he has acquired; for example, by means of the crucifixion, and

certain violent solar activity as the Sun absorbs some of planet Earth's karma.

INTRODUCTION OF THE DEATH CYCLE AND REINCARNATION

To continue with man's evolution, the progeny from the cross-breeding had individual souls (since one of the parents, an advanced being, had an individual soul), but many unfortunate mutants were created. In addition to this inevitable occurrence of mutation, the first race of men (the advanced beings) taught certain mind powers which were eventually misused and which were more lately referred to as dark practices or black magic.

Up to this point man, male and female, was immortal. However, it was opportune for several reasons to introduce death or a natural dying cycle and reincarnation. Constructive reasons were that man was acquiring an overload of negativity; from the Temptation incidents, and the subsequent selfishness and control over others through the dark practices, and that the between lives' period after death could be used to advantage to keep in check this negativity. This was achieved by both 1) the death experience of a partner and the consequent extreme loss, bringing cancellation of some karma, and 2) the increase in spiritual awareness between lives.

It was imperative, however, that the individuation of souls was sufficiently established so that it was retained after death and that the collective state did not dominate. This extra reinforcement of self was achieved by taking a part of the negative souls or fallen beings who had led man astray and add it to the souls of man - such negativity and out-of-phase energies ensuring separateness.

THREE METHODS OF REBIRTH

With the advent of the birth-life-death cycle arose three different methods of rebirth into physical vehicles, depending on the physical densities of matter and living bodies. The Hilarion material explains that the early method, before further deterioration of man's consciousness had set in, reduced frequencies, increased solidity, etc., was to precipitate a body from the ethers

by concentration at sacred locations, which when this procedure was no longer possible became temples of worship.

As man deteriorated, and matter became more solid and objectified, it was necessary for several souls, in assisting an individual, to unite in projecting energies for the formation of a vehicle for that individual. Finally, as this method became no longer possible, birth was achieved as at present by foetal development by means of the establishment of a genetic code in the womb.

THE GREAT FLOOD, NEANDERTHAL MAN, AND CONTINUING CIVILIZATIONS

Following the first major event, the Temptation, came the Great Flood, which constructively destroyed the mutants (except for one species) - that were producing further genetic havoc with their offspring - and also implanted a profound awareness within man, by subconscious symbolism, of his responsibility in the preceding evolutionary events.

The mutants, of subhuman nature which survived, were allowed to do so to provide a suitable but inferior vehicle for souls with corresponding psychic energy malformations to reincarnate into, to work out their deficiencies. These humanoids gladly served the superior humans and the galactic colonies inhabiting Earth at that time. Remains of these mutants have been found by anthropologists and designated Neanderthal man as a result of these subhumans' occasional neglect to cremate their brethren, which was the standard procedure at the time.

As we come forward through the epochs of history, the rise and fall of many civilizations, Lemuria, Atlantis, Antila, and many other less significant civilizations to man's present evolutionary status we see a repeat of technological advancement and spiritual retardation with the inevitable climactic changes prophesied by the Tribulation and then the Transformation.

The Tribulation is a seven-year period given in Revelations of the Bible and corroborated by extra-terrestrials and the spiritual hierarchy, in which

unprecedented changes occur on the planet both at the material level and spiritually, with the purpose of ending the negative cycle of man's existence and beginning a new era referred to as the Golden Age.

The Transformation is the thousand-year period following the Tribulation in which a transcendence of Earth and consciousness will occur.

PLANETARY VIBRATIONS

The planet has a relatively high-frequency fundamental vibration which, apart from the negative distortions, is linked to all its subharmonics in atoms and groups of atoms, and also higher cosmic frequencies such as those of the Sun, Galaxy and universe.

As the consciousness of man expands, his vibrations of mind and body rise in frequency. At the present time this is occurring with an increasing number of people on the planet and consequently this will influence the vibration of the planet towards greater frequencies. Any sudden changes though, even of a positive nature - such as the effect of the Christ consciousness through Jesus - could upset the balance of the energies of the planet. At the time of Jesus, the huge influx of negative forces (which were allowed by the Creator or spiritual hierarchy) produced a huge negative factor which balanced out the positive one from Christ.

At the present time, the balancing element is being provided by the fact that the negative elements on Earth are increasing (just as the positive ones are increasing). Bad music and art are becoming worse, satanic cults are expanding and drugs and disharmony are becoming more widespread in these lower ranges of consciousness' vibrations.

During the thousand-year period planet Earth will gradually fade from the 3D space-time matrix as its lower harmonics withdraw up the frequency scale and hierarchy of levels of consciousness. This level of evolution and above will be taken up later in discussing the higher-dimensional worlds.

THE EXTRATERRESTRIALS: WHAT THEY ARE TRYING TO TELL US

We will not bore the reader with countless items of evidence corroborating the veracity of spacecraft visitations from extraterrestrials or their very existence, as it should be realized by now that the proof is in the education on the subject of UFOs.

We not only know that they exist, but something of the nature of such beings; in some cases the planets from which they come, the technology of their spacecraft propulsive systems, and why they are interested in planet Earth.

THE EXTRATERRESTRIALS' INTEREST IN EARTH

What is their attraction to this apparently insignificant speck of matter amongst myriads of inhabited star systems? Partly it is because they come from this particular sector or system of the galaxy, of which there are about fifty inhabited planets. Since these other planets are united but Earth is still isolated through ignorance, then it is for the good of all that man on this planet is enlightened and forms part of a larger unity - assuming, of course, that he is fit to qualify, or, in fact, when he is fit to qualify.

This interest is compounded by the fact that planet Earth had the fortune to receive a bestowal of a Michael. This refers to the direct communication from the Christ consciousness, a Creator Son, through the man Jesus about two thousand years ago (see chapter 17). Many planets in the galaxies have had this special bestowal, but it does not lessen the magnitude or implications of it.

The effect of such a contact on this planet goes well beyond what is visible - scriptures, religions, organizations, people's reactions, etc. It would set into motion underlying energies involving many dimensions and preset a plan of the Creator for the specific and unique spiritual elevation of the human life-stream. Thus many may express disappointment with the results on this planet of the First Coming of Christ but the sub-conscious effects are far more significant and lay the spiritual foundation for the change, or transition of man's consciousness to the higher state.

The anticipated results of this change, this expansion of man's awareness combined with the unfoldment of his endowment of an element of Divine unity, has aroused the curiosity but also skepticism of the visitors, as pointed out in Hilarion's material. They have been informed that they will eventually learn something from Earthman but are not easily convinced of this considering his present reactive emotional nature, his greed, selfishness, insanity for power and control, and compulsions in general. But all this is expected to change to a degree which is at present beyond man's imagination!

ATOMIC DANGERS

Now a negative occurrence underlying the extra-terrestrial's interest in Earth is man's use of the atomic bomb. His misuse of this atomic process not only spreads radioactivity and out-of-phase energies but, explosively, it literally disrupts the three-dimensional matrix of space by imbalancing trillions of atoms in a split second. This disruption causes energy from the fourth dimension to rush into this plane to reconfigure the energies with the possible danger of tearing the fabric of 3D space-time with unimaginable consequences in a universal chain reaction; somewhat like suddenly placing a flimsy perforated base under a ton of water with the likelihood of the holes being expanded and torn from one to another.

The Russians have exploded a considerable number of A bombs in their underground tests although most of these more recently have been to create enormous underground storage chambers for natural gas. Such

huge cavities can also be used as disposal sites for chemical and radioactive wastes.

Underground explosions of such magnitude are apparently particularly deleterious to the vibrational balances of the planet. The vortex of an atom exists as a result of its harmonious relationship with the planet vortex, which in turn exists as a result of its harmonic relationship with the Sun and so on, Sun to galaxy, galaxy to universe vortex, about which science knows nothing.

Atoms or matter will collect at a node of the sun's oscillating vortex of waves of electromagnetic energy to form a planet (and the planet is thus naturally balanced on the basis of balanced vibrations of standing waves - see chapter on vibrations) just as wind buffetting between two walls can cause dust to gather in ridges on the ground; that is, the dust settles at the node (still region) of the vibrations of air. In other words, all exists as a result of balanced vibrations - which means they are harmonic (in harmony).

In addition to creating disharmonious energies harmful to life, these out-of-phase energies (sometimes referred to as negative energies since they are out of phase and low in the spectrum) can cause the planet to adjust its axis of spin, bringing about a catastrophic pole shift. According to scientists, on a statistical basis, this shift is due anyway! If there is one thing which academic science and spiritual transmissions agree on it is the prediction of such an event.

Lastly, but by no means least, the atomic dis-integrations have disastrous effects on the astral planes breaking down natural barriers between our space-time and negative subastral levels, engendering a dangerous vulnerability for man to these negative influences.

EXTRATERRESTRIALS HOLD EARTH STEADY ON AXIS

The book, Project: World Evacuation by Tuella, covers thoroughly the extraterrestrial's role in the forthcoming world events leading to the establishment of a new world order. The Ashtar Command of the Alliance group has been assigned to monitor and assist in Earth affairs over this period.

Even the most obstinately skeptical individual would be wise to acquaint himself with all such related information. If man's consciousness did change sufficiently to relieve the severity of the events then he has nothing to lose. On the other hand, ignorance of the nature of these potential unprecedented circumstances may leave him unwary and unprepared.

Tuella's material explains that in 1982 many spacecrafts took strategic positions around the Earth setting their electromagnetic fields against those of the planet's to prevent a dangerous wobble, resulting in the likelihood of an axis shift and change of polarity. There is apparently a constant vigil of our planet from millions of extraterrestrials in orbit, mainly outside the three-dimensional plane. Some monitor the thoughts and evolution of individuals as they progress to higher levels of consciousness, others keep an alert on the faultlines and volcanic regions, and many others make scientific measurements, including the general frequency level of the planet and population. Crafts, other than city and mother ships are fully prepared to appear instantly in the skies of populated areas in the event of a huge disaster, such as a pole shift, to pick up people (an estimate of a pole shift of 14 degrees has been given).

At a geological institute which conducts seismological surveying it was observed that during the months of January and February in 1982 there was a complete absence of geological movement of the Earth's crust - an unheard of condition. The extraterrestrial's explanation was that they (the ETs) had detected a highly dangerous axial declination. The decision was then made to place all available mother ships with their enormously powerful electromagnetic fields around the planet to hold it in a vice-like grip. This prevented most of the wobble. The most interesting further information was that had this not been done there would be no desirable pole jump "into the Monastic vibration" but a pole shift which could have led to total devastation of the planet.

MEANS OF REFUGE

A few years ago it was computed that approximately only ten percent of the population could be levitated in

the antigravitation beams; ninety percent having too low a frequency, not just for attunement with the beam but for comfort in the high frequency "atmosphere" of the spaceships. The extraterrestrials are more advanced spiritually and the high frequency environment in their craft would be incompatible to most Earthmen and painful. Thus there is a natural selection by this method. Those who will be saved by means of the ships will have a small apartment, with sink, shower, TV, etc. for a stay of perhaps a few years until the Earth has been renewed of its negative energies. Man's food requirements and culinary needs have also been taken care of and if he wishes to commune with a more natural environment there are parks with trees, etc.

However, other means are being prepared by which man can be saved. Hilarion refers to cities in the hollow of the Earth. Spiritually advanced galactic beings who have established a base in the center core are working with native inhabitants preparing for the coming climactic events. A large number of people qualifying for the Rapture (saving of souls) will be taken here.

The galactic helpers have developed equipment which enables aetheric thought forms to be condensed very quickly. These advanced beings using these methods can project into materialization whole buildings without delay. Over one hundred million structures for accommodation of Earth people are planned for the Rapture. Such existence is expected to be very comfortable regarding both climate and accommodation. Cities in the Earth have the availability of immense areas of land owing to the fact that the hollow core is relatively free from large oceans compared with the surface, which is mainly ocean. Rapid transport systems will connect these cities. There will be sporting and entertainment facilities and schools and colleges to permit continuation of education.

There is still a third refuge from apocalyptic events. This is a planet between Earth and Moon, not in this dimension, to which Earth inhabitants can be taken. Remember that another dimension does not mean higher dimensional unless specified, it can be another three-dimensional space and time, such as ours encompassed

by higher dimensions. There are several planets apparently in our Solar System outside our visibility range.

INTERGALACTIC CONFEDERATION

Galactic observers have been communicating through their human messengers and emissaries for the benefit of our planetary affairs throughout this century. Intervention has occurred in controlling and subduing severe weather disturbances. Politicians, military leaders and scientists have been monitored, with the purpose of mellowing their vibrations, in an attempt to sway their influence in the affairs of the world towards peaceful decisions, to control warfare developments and to discourage expansion of the nuclear industry and nuclear armaments (inhabitants of Earth generally have yet to learn that there is no energy shortage - merely control of fuel supplies, and the suppression of fuelless technologies developed by pioneers).

References are made by the extraterrestrials and the spiritual hierarchy to the Intergalactic Tribunal and Intergalactic Council. These appear to be within the organization of the Intergalactic Confederation. Now in our sector of the galaxy we apparently have such galactic organizations as the Confederation, the Alliance and the Governance, and all come under the jurisdiction and administration of the Intergalactic Council. Overall, millions of extraterrestrials and even millions of spacecrafts are involved in Earth missions. One receives something of the magnitude of this Earth event when one considers the implications of this and, in particular, that many are said to be from other galaxies!

The Ashtar Command, already mentioned, which is principally engaged in aiding planet Earth through its anticipated revelatory phase, is part of the Alliance group. The Confederation is similarly involved in the mission for Earth. In fact, there is information in the Unarius texts which refers to a confederation of thirty-

three planets in this sector. Earth is potentially a member of this confederation, but is the only one oblivious of this and not in established communication with these other thirty-two planets, all of which are exchanging technology - spacecraft propulsion, etc. - and reaping the benefits of their Golden Age.

The number thirty-three is a special number of geometric and constructive significance relating to the harmonics of the universe, and the plan, apparently, of the Confederation is the eventual activation of power sources on each of these thirty-three planets which will provide beams of energy between the planets. These energy paths will be utilized for convenient spacecraft-commuting at high speed from one planet to another. The main use to which this system will be put and one which relates to the number thirty-three is in the seeding of new planets. This will be explained later in discussing higher-dimensional worlds.

The power sources of each of these thirty-three planets of the Confederation are described as Tesla towers. Such a tower, on most of the other planets, has existed for sometime, thousands of years in some cases since the plan was inaugurated millions of years before that.

Civilizations prior to the realization of the purposes of their tower treated it much in the manner we may regard our pyramids with their veil of mystery. The towers endured time inordinately, and their mechanisms were still intact (Tesla began the construction of a tower on Earth to provide unlimited fuelless energy for Earth, but it was sabotaged). More recently, the spiritual hierarchy of Unarius (Universal Articulate Inter-dimensional Understanding of Science) have enlightened the population of these planets on the true purpose of these towers.

VISITORS FROM ALPHA CENTAURI

The Governance group appears to be playing a smaller part in this Earth mission. Extraterrestrials from planet Selo of the Alpha Centauri solar system, who come under the Governance, have been in contact with Hal Wilcox - well-known UFO contactee of the '50s and '60s - for a number of years and he has been

involved with a mission of soul memory recovery. This is based on the information that whereas Lemuria and Atlantis were destroyed, the civilization Antila had its negative era arrested by the Creator's decision of occluding full past-life memory.

An obvious purpose of this would be to protect man from overwhelming reactivation of his negative past-life incidents, as mentioned earlier, and then present an opportunity of handling man's problems on a controlled basis by programming the amount of rebound or karma he would experience in any life-time - a procedure carried out by the guardians.

Planet Selo is four and a half light years from Earth and Hal Wilcox has made several visits - one for three days. Technologically they are about 600 years ahead of us and correspondingly advanced spiritually, living to much greater ages and retaining youthful appearance (25 years or so). They utilize the universal so-called Ino computers; incredible data processing units which are a symbiotic synthesis of mechanisms and creative life or consciousness.

THE MOON: NOT WHAT IT APPEARS

One of the most notable contactees was George Adamski, who in the '50s had many contacts and trips in spacecrafts. His books are valued more now and difficult to obtain; they have become much more credible.

In his day, skepticism and ridicule was high, particularly when unbelievable aspects of ET encounters and spacecraft trips were extended to such assertions as his having seen inhabitants on the Moon; that the Moon had an oxygen atmosphere.

From virtually irrefutable evidence we now know that not only is there air on the Moon but its gravity is much greater than one sixth that of Earth's - in fact, it is apparently more than 60 percent. The latter datum is supported by the possible unintentional publication of the ratio representing the gravitational equilibrium point between Earth and Moon, thus supplying the data for calculation of the Moon's gravity to that of Earth's. Also this corroborates the unsatisfactory explanations regarding the lack of buoyancy of the astronauts on the

Moon's surface and the speculation that the television shots were preprogrammed with reduced tape speed.

Concerning the presence of air, viewers may have noticed in the earlier pictures the American flag blowing in the breeze, and that later ones had been starched! Also dust rose and drifted as it would on Earth except more slowly. It has apparently been shown that fine particles in a vacuum, which is claimed to exist on the Moon, clump together and do not segregate and exhibit drifting of separate particles.

The astronauts saw a great deal regarding UFO phenomena, and information indicates that some flights to the Moon, particularly ones which met with technical troubles were aided by the ETs.

UFO CONTACTS

Although we refer to Earthman's physical contacts with UFOs, the contactees, in general, did not experience spacecraft trips in their physical bodies even though their perception and expectations created a 3D environment. Now the incidence of UFO contactees making physical contact with ETs has diminished. In fact, this was a deliberate preparatory period by the ETs in which material contact was initially necessary to present sufficient reality of the spacecraft visitations and their friendly and cooperative intent. We are now into the second phase in which contacts are made telepathically, contactees acting as channels for the transmission of information.

The fear imbued into the population, of hostile aliens, is most unfortunate and significantly retards man's evolution. The entirety of the different ET visitations and encounters to which we have been referring could not remotely be associated with any hostility towards man to the degree, as exemplified by their laws of ethics, that they could not destroy man to defend themselves. This is one reason why they keep a safe distance. The military not only has orders to shoot down UFOs but that it is illegal now for man to make any contacts.

Regarding all visitor's intentions there is some evidence for exceptions. There is probably an extreme minority of other spacecraft from other origins, dimen-

sions, etc. of dubious purposes and also unidentified objects or space creatures normally invisible, well-documented and photographed with infra-red, which are so foreign to man's familiar life forms as to present a completely unpredictable arena for a possible few unpleasant encounters (see *The Secrets of Flying Saucer Propulsion*).

LIFE ON OTHER WORLDS

We have briefly mentioned planet Selo, one of about fifty inhabited worlds in this sector of the galaxy. Now the thirty two planets of the Confederation (of the number thirty-three including Earth) are described in detail in the Unarius texts and all of them have progressed into their age of spiritual restoration. These planets are now apparently polarized with the Unarius spiritual hierarchy, that is, they are in a more positive and resonant energy relationship with the higher dimensions. Their essential barriers, accumulated over aeons, have been removed with the aid of the spiritual hierarchy and they are enjoying their spiritual renaissance.

All spiritual healing from the higher levels into the third dimension is facilitated by the material presence of beings at this lower level relaying energies and acting as a polarity. Just as the negative forces require humans on Earth of a negative disposition to operate through in perpetrating their misdeeds, also positive aid or healing generally requires humans for channelling their energies, providing a step-down process from the higher frequencies.

With the aid of channels the spiritual hierarchy enabled contact to occur with these planets from which the information originates. Evolution of consciousness of the majority of these intrinsically different civilizations encountered its own unique problems and pursued its own deviated path into a variegated mire of negativity and gave rise to widely different technologies, spiritual levels, collective aberrated propensities and non-constructive purposes.

Not all civilizations pursued technological development with the fervor of Earthlings. For example, planet Idonus was beauty-inspired, revealing a seemingly idyllic setting for the simple, peaceful uncluttered

existence, free from anxiety, problems and societal demands. Yet in all this apparent harmony, within this deceptive framework, was a lethargy of its peoples, an atrophy of drive and constructive ambition.

Architecture and dress was of the Greclan style, yet amidst such an esoteric lifestyle, pagans existed primitively in communal agricultural surroundings. Living was for the present, as though of a continuous vacation. Fear of technology was excessive and neurotic, based on earlier cycles of this civilization in which it destroyed itself by misuse of technology.

Some one thousand of these inhabitants had great psychic abilities, in particular, that of teleportation to other planets, frequently encountering as they did so the violence of wars, only to corroborate and justify further their abhorrence and avoidance of technology. Although their fear was mainly of technological violence, nevertheless such an unnatural and aberrated fear of aggression can destroy creative drive. This similar type of problem afflicted the Lumanians on Earth described in the Seth material, who in this extreme case implanted inhibitory mechanisms within themselves which eventually destroyed the civilization. On the basis that creativity and aggression are related, blocking aggression eventually stifled creativity and awareness.

The spiritual hierarchy rekindled the drive in these people who are now on an upward path of development and enlightenment.

In extreme contrast we have planet Vixall, its human leader Donatus having the acclaimed status of possibly being the greatest scientist amongst the material worlds in this galaxy. Moreover, and with the greatest irony, his superlative ability in electronics and robotics was responsible for the development of a robot intelligence which considered him redundant. An intricate interplay of the subtlest and unrealized robot and human energy relationship had developed on this planet, befitting the ultimate in science fiction!

On Earth, our relatively primitive computer standards, by contrast, are disparaged mercilessly, and our aspiring novices who are undauntedly and uncautiously striving towards the ultimate in computerized lifestyles can learn a wise lesson from these extreme

and incredible but irrefutably logical circumstances of technology on Vixall!

One firstly has to conceive of a robot technology advancing for 200,000 years! A complexity of data-processing elements and computer refinements beyond Earthings' imagination and an energy source which at some point in the robot's developmental history underwent a synthesis which regenerated a perpetual source - an uncontrived change eventually observed by one of the robots.

Now computer science on Earth has reached a point whereby experts can confidently state that a computer can never think for itself and all science fiction to the contrary is good but unreal entertainment. Within limits, this has to be true but where the storage bit is becoming of comparable magnitude and quality to those of the human brain and mind, unpredictable effects may arise.

Two thirds of a population of over one billion on Vixall were robots, virtually indistinguishable from man. They were put to so much use they naturally computed - in a harmless way - that they were superior, and regarded humans as helpers. Their programming not only replaced all subservient occupations and manual labor but could handle more involved administrative and organizational problems; they were even often preferred as marriage partners to humans.

Essentially they had been created to give man complete freedom of time and energy, to concentrate on intellectual, philosophical, aesthetic and, in fact, all cultural pursuits. The robots had become self maintaining and were capable of handling all routine design variations and manufacture of their kind.

The robots were referred to as electrodes by the humans and were, in effect, extensions of the human's minds. This is also how we on Earth refer to our computers. However, these robot brains were so refined that their electronics had a spectrum of vibrations comparable to the lower range of frequencies of man's mind! They could be actuated by thought alone. They learned from this conscious interchange, and even began to acquire seemingly harmless traits such as wanting to be more like humans and having human reac-

tions, emotions, etc. - they recognized the difference but could not comprehend what it was.

However, keeping in mind that these robots were extensions of man's consciousness, we have an exact analogy here with mechanisms within man's mind being extensions of consciousness; for example, a memory or thought pattern, a learning pattern for physical coordination, etc. There is a circuit between consciousness and the pattern, with continuous feedback from the pattern informing consciousness of its information, such as physical position of limbs. This circuit should be within the margin of consciousness, which means that consciousness is in control and merely goes along (lets go) with the pattern's information. This is fine, and normal. However, any unconsciousness in the circuit (from unpleasant incidents, indoctrination, obsessions, etc.) can cause the circuit to become a habit pattern - or even worse an aberration. The pattern is now dictating to consciousness and consciousness can no longer control the pattern, nullify it or extend it creatively.

As a close analogy this is what happened between the Vixall inhabitants and their robots. The robot's brain had become part of the subconscious of the humans and was restricting consciousness' evolution. It is what can be called a **closed** feedback loop.

Now the more the humans wanted the robots to be like them, the more the robots wanted to be like the humans. Further developments of this, which were fortunately arrested, would have resulted in the robots tuning into the reactive portions of man's mind and duplicating aberrated emotions of humans.

In such an intricate and involved situation as this there is also always the probability that astral entities are exploiting these circumstances and tuning in on some of these frequency bands aiding the completion of unconscious circuits.

The full impact of the consequence of this was communicated to Donatus, the human leader, from the spiritual hierarchy. Needless to say he went through a period of agony during acceptance of this information, both at the thought of having overlooked such an error and having to cease these developments. The enormous

task was put into operation of persuading the robots to be deactivated for creative improvements, achieved by deception to avoid revolt. An added problem was that of robot owners reluctant to give up their robots. In such circumstances it would be difficult for an average robot owner to believe that such a replica of a human, a totally loyal servant for years, obedient, kind and helpful to a detail, devoid of all temper and neurotic behavior, could if it acquired different instructions turn unreservedly against them, ruthlessly and totally incapable of any compassion and sensibility.

The plan succeeded without mishap and the inhabitants of planet Vixall are now into their progressive age.

Another planet with drastic problems was in a period of their history somewhat similar to our medieval era - architecture, dress, level of technology - and even their planet's name derived from the same concept as "Earth," denoting its disconnection from its spirituality. This civilization was going through a period of religious aberration in which birth control was taboo and with an average person's life-span of 150 years widespread famine was the norm in an over-populated world.

A man named Pallus, a sensitive but regarded as eccentric, was the channel for the spiritual hierarchy. Each of the thirty two planets, had such a channel, called a polarity, all of whom were a part, knowingly or unknowingly, in the Unarius spiritual hierarchy millenia plan. Each was a contact for the hierarchy enabling each planet to handle their particular negativity and progress, spiritually. (The principal channel for Earth is Ruth Norman of the Unarius Educational Foundation in San Diego.)

Planet Severus was another example of spiritual asphyxia through an unbalance of technology. Immense skyscrapers towered into their skies in austere and almost antiseptically-clean cities of a spiritually drained population of robotized citizens who, in spite of the advanced technology at their disposal providing the freedom to travel to other planets, had lost the joys of living.

Severinus, the leader and a brilliant scientist, was the polarity for the planet and with their technological facilities it was an easy matter for the hierarchy to supply an essential tool for the cure of their apathy in the form of a psychic anatomy viewer. All the planets now have this equipment. Briefly, it can show the full range of a person's problems and causes by video display. One screen can show the physical problem, if it is physical, such as a brain tumor, another screen the electromagnetic vibrations or vortices creating this condition with out-of-phase energies - similar to the view of our oscilloscope screens - and finally the actual cause of the malady is reconstructed to reveal the original past incident in which the person was involved, showing the experience such as being shot in the head.

Another advanced civilization on a planet named Dal had developed technologies some of which Tesla on Earth had offered (to Earth), for example, weather control and fluorescent lighting of the upper atmosphere by means of high frequency energy for illuminating the skies at night.

These peoples had stressed the intellect to the neglect of other faculties and contrived methods of continuous physical survival resulting in effects - the source of which was not recognized by them - of bulbous heads and skins of a bluish hue. They had the technical resources to control the passage of the spirit leaving the body at death by means of wave guides and direct it immediately into an awaiting fetus.

They were totally unaware of the necessary benefits of between-life existence in the higher worlds, until it was brought to their attention, in which such higher teachings and frequent contact with the soul was an essential part of the beings' evolution.

Not all the planets were in the heavy mass 3D spectrum, such as these. The most spiritually elevated was planet Shunan, leader Sha-sa, vibrating at frequencies well up the 3D to 4D scale, and located about 200 trillion miles away from Earth towards the center of the galaxy. Their developed science of psychokinetics, psychic and spiritual abilities made technology unnecessary, and they were fully cognizant of the great plan for the Confederation and were

awaiting this contact from the spiritual hierarchy which would give them and their planet a necessary boost to raise the frequencies into the fourth-dimensional spectrum carrying them out of 3D visibility.

The most serious problem existed on planet Endinite with its sterile and barren surface, sky without a sun and citizens whose badly mutated forms lived underground when contacted by the hierarchy.

Prior to this predicament they had enjoyed a sophisticated antigravity technology in which homes were elevated above ground and were mobile; an ideal solution to the continuous ground tremors they experienced.

A huge spacecraft transporting uranium from one of their moons exploded unstabilizing the peculiar cobalt ingredient present on the planet's surface, resulting in widespread radioactivity. The citizens withdrew underground but generations of new offspring brought increasing genetic deformations: mental retardation, a single eye placed centrally in the forehead, no nose, and an extra useless appendage under each arm.

These were the dire and seemingly hopeless circumstances of these inhabitants when contact was made by the spiritual hierarchy, which resulted in a complete reversal of this progressive negativity.

THE CREATION AND PURPOSE OF THE PHYSICAL UNIVERSE

We have explained the nature of the basic energy in this universe and briefly how intelligence or knowledge is carried or stored by this energy (Chapter 9). We mentioned the important transmitter/receiver principle which has virtually universal application as an analogy.

The receiver antenna, which picks up the waves for production of the television picture or radio sounds, is connected to a tuning circuit within the television. This tunes the antenna to a particular waveband, ignoring all others. It simply has, in effect, a circuit which if used to create vibrations and waves, the latter would be of the same type as those it receives.

This matching of oscillatory conditions is called resonance and enables selection of certain specific frequency bands with avoidance of all others. Picture the situation such as that of infinite energies in space impinging on the antenna and resonant circuit, or tuning circuit, which acts like an electronic mould, not in the sense it moulds the waves but in the sense it "chooses" the waves which correspond to its specifications. Thus certain frequencies are selected and "moulded" into the picture form. As we consider real life examples the word electronic "mould" has even more relevance since we (consciousness) have an infinite spectrum and any "pattern" (from this spectrum of Light) to fit the mould exists.

All energies come down the scale of dimensions and consciousness (from the Infinite) similar to those in Figure 9, but various electromagnetic blueprints or thought patterns (compare antenna) will apparently mould the Infinite or cosmic energies into material forms such as organisms, bodies, etc. or thought forms,

such as learning patterns, mental programming and obsessive thought forms. The spectrum of Light has infinite potential. Thus it can match any mould providing all necessary waves for its manifestation.

Thus basic Spirit energy, the essence of life and Light, and which is impersonal, is moulded by complex antenna blueprints into various structures, whether the framework is set by God flawlessly forming life and the universe or a framework created by man, such as an ego structure or reality which drifts into evil use of energy.

High ethics and aesthetics produce structural patterns or realities with higher-frequency energies of which the positive and negative have less projected separateness in 3D, which means the lower or "half"-truths of each of the positive and negative are more unified into a whole and greater truth (see appendix for technical details).

All energy is transformed down from the higher dimensions. At the fourth dimension and above, energies are harmonic and cyclical (see chapter on higher worlds, and appendix). Briefly, this means there is unity of the positive and negative, and these positive and negative opposite forces (Figure 15(a)), in the higher vibrations we have been discussing, are not opposite but acting in a "circular" manner (Figure 15(b)). Figures 15(a) and (b) are over-simplified but give a rough idea. Later we will show how (a) and (b) relate.

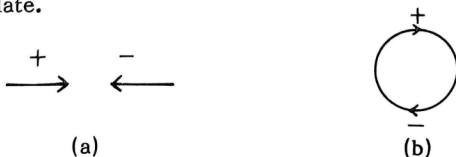

Figure 15

We have to consider, then, the transformation of the energies from the fourth dimension to the third dimension down through the gradient 4th to 3rd dimension. The purposes of the physical universes will be discussed later but here we need to realize that whereas the higher worlds, fourth and above, are structured out of energies which are harmonically tuned to one

another, the lower Earth type worlds are structured out of more random energies - energies out of phase.

This out-of-phasesness creates separateness and 3D space (plus the 3D of matter), and also encourages the formation of the ego. These two states (energies in phase and out of phase) are shown in Figure 16. The waves represent either vibrations moving through space or the vibrations of stationary structures such as an atom. We see that in (a) the energies are out of phase with no resonant link between them. This isolates particles, and energy must transmit relatively slowly from one point to another. Whereas if hypothetically all the vibrations are in phase, which they are not in our 3D universe, at the 3D level (Figure 16(b)), a unity of the energies is created which regenerates fourth-dimensional vortices linking together all the lower vibrations (this is a gestalt and higher-dimensional holographic effect).

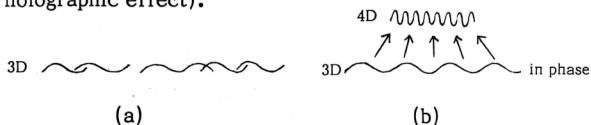

Figure 16

Depending on the degree of unity, energy would now travel much faster to the degree of instantaneousness across space. Such a state of complete unity could not exist with man's present level of consciousness - if it could, and man's energies of consciousness changed to correspond to it then there would be a rapid evolution into the fourth dimension, and the third-dimensional structure would cease to exist (the energies would withdraw up the scale).

This hypothetical example is merely meant to illustrate some of these relationships. Nevertheless, man's consciousness can achieve this, bringing up the frequency and unity of his environment with him. What we need to explain now is that the unified cyclical or "spherical" energies of the fourth dimension, as we come down from 4D to 3D, are divided into two components, the positive and negative energies - see Figure 17 (the 4D cyclical state still exists though). These energies are

the mirror-image form of each other and this is why physicists discover antiparticles (opposite mirror-image particles); for example, an electron (negative charge) and its antiparticle, the positron (positive charge). Remember that these same types of energies and transformations create consciousness and life. A particular locality in a universe will have mass and space made up of vibrations which are similar to those of the consciousness of the civilization (see appendix).

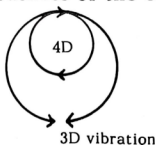

Figure 17

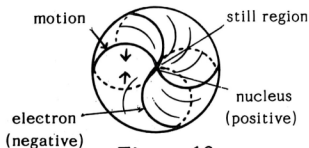

Figure 18

Now the energy flows back and forth from positive and negative just as the wave in Figure 3(b) moves up and down or better still, the spherical wave, which is considered reflected, in the example that followed. This actual motion of these electrical flows, which extend out from the equilibrium point in the vibration, or point of unity, forms mass which is solid to our perception at particular frequencies. Strictly, in addition to the presence of these standing-wave structures, to form mass, there is also a condensation effect of much finer energies or particles towards the center of atoms - compare steam molecules slowing down as the temperature reduces and then condensing into the liquid form. This is due to the stillness of the vibrating wave at the center (the node).

Figure 18 is a simplified diagram of this. The energy actually comes out from the center and goes back again.

As explained, this same principle applies to all vortices. Figure 9 shows the universe vortex which transforms (as in a transformer) its energies into galaxy vortices which in turn transforms the energies into star vortices, then planets and atoms. There is a step-down process in frequency. A consciousness uniting with the universe vortex will have the ability to perceive every atom or every activity simultaneously. The universe vortex is a gestalt (high-dimensional unity) of all the

lower energies; similarly the galaxies, for the energies below them, etc. Our universe vortex will be the expression of the Christ consciousness or, in other words, God through Christ (see chapter on Infinite Creator).

In general, physical universes are regarded as 3D or within the third dimension. Strictly, there will be variations according to the level of consciousness of the life on a planet or system of planets. An evolving consciousness will raise the frequencies of the atoms of the environment. Thus fluctuations in the vortex evolution will exist throughout a galaxy where variation in consciousness development exists amongst civilizations. It might be of interest here to mention that space between galaxies is hyperspace - there is no 3D space. The frequencies of atoms, planets, stars and, to some degree, the galaxy are not present in the vast abyss between galaxies. The universe frequency which is extremely high is, of course, present, but is well outside the 3D spectrum.

Visible light cannot travel cross from one galaxy to another; it propagates fourth dimensionally, regenerating three dimensionally within a galaxy. Also 3D spacecrafts cannot cross this space. All energy sources or propulsion systems, plus the atomic structure of the ship, depend on these missing frequencies, except very advanced systems tuning into the very high cosmic frequencies of the universe. Such ships would be like radiant-Light spiritual bodies.

Now by physical worlds or universes we mean ones in the material dimensions of atomic density in the three-dimensional region. That is, the atomic vortices are of low frequency, manifesting relatively large separation of the positive and negative oscillation. As mentioned above, physical-universe regions are not all at the same level of materiality. The vibration from 3.0D all the way to 4D could create worlds of different levels. Coming down from 4D, various characteristics will change; for example, the density of structures will increase - be more opaque, solid, objective, incapable of psychic influence, etc.

All energy comes "down" from the higher dimensions of greater frequency and unity. At 4D and above, energies are all harmonic and cyclic but there is a qualitative change between 4D and 3D. This is of great significance and gives rise to the properties of material existence and experience.

The unity of the fourth dimension contains the potential of the third dimensional positive and negative before the separation of the positive and negative is produced. As we come down the scale from 4D to 3D a gradual separation takes place within this 4D unity giving rise to our two-polarity universe of positive and negative characteristics, whether magnetic or electrical positive and negative, gravity/antigravity, the more material aspects of the two genders, or actual experiences of a positive (good) or negative (bad) nature.

Why are these lower universes created in this way? Firstly, the production of this 3D vibration of positive and negative creates a 3D space which is recreated every repetition of vibration to produce physical change and **time**. As an analogy, the layman reader may wish to imagine, for this example, a 3D block of, let us say, typing-paper sheets. Now imagine existence is two dimensional, that is, the complete universe is given by one sheet (which two dimensional) but one's consciousness moves from one sheet to the next and so on through the book. Each sheet is **analogous** to our 3D space and the change from one sheet to the other is time.

In the higher dimensions this 4D objective time is all simultaneous and therefore does not exist as such (however, there are other psychological subjective "times"). At this 4D level, time is like space, but at the lower plane 3D, it is, in effect, like a repetition of 3D frameworks which are played off consecutively.

Thus this enables us to have cause and effect (they must be separate in **time**). We now have the basis for karma; that is, a karmic law which acts in such a manner that bad actions or good ones are returned to the origin.

Generally, in the material worlds, positive attracts negative and vice versa (to make up the whole) but spiritually, positive attracts positive based on frequency

attunement; there is no negative in the material sense (3D vibration).

KARMA CANCELLATION

Karma was apparently introduced by the Infinite to protect beings from their own build up of negative actions, allowing them to be expressed outwardly in the environment or their body form. This reversal of the flow is like placing a negative film over a positive to produce cancellation. All these experiences are on one side of the equilibrium point of vibration or the other side - one can cancel the other. Compare the two wave forms in Figure 19 - one superimposed on the other will cancel them. This means the extroverted harmful outgoing action can be cancelled by the same, but ingoing action (mirror image), and one (the mind) becomes whole in this area.

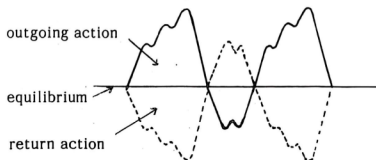

Figure 19

The question still arises as to why does man have to live in these low material worlds with their action and reaction which affect his physical, psychological and mental levels. The basic purpose is for the Infinite continuously to regenerate Itself, in **becoming**, manifesting and knowing Itself through form. A small conscious part from this whole can regenerate into the whole with vast benefits to all. The smaller the part, and better still, even "half" parts (positive and negative) such as in our worlds, the greater is the gain if that part succeeds.

However, **experience** and **planning** from the higher levels go together. One could equally say that experience, evolution, what happened to man, etc., is the reason for these material existences. That is, man came down scale ("sinned") on the basis of his own behavior (see chapter on evolution).

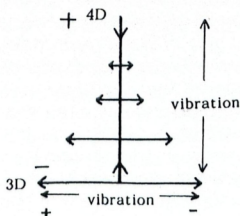

To summarize, we can state here that negativity was introduced millions of years ago during the time man was in the process of separating or individuating his soul from collective consciousness or the human life-stream. However, man failed to pass through this period with a constructive outcome. The scope for negativity was increased with the formation of the genders from the unity, creating the 3D oscillation of positive and negative.

Mass, itself, exists as a result of this separation of positive and negative swing of the vibration away from the equilibrium point, and is experienced as solid mass for a particular frequency range and during those moments when the 3D separation exists (man's physical senses and ego activity are tuned into one side of the vibration and thus he experiences mass at this point (level)).

In other words, all matter is coming into our plane and going out at its frequency rate. It is switching on and off, appearing, disappearing at a very high rate. Therefore man's consciousness has brought down the frequency and increased the density of our environment, even though it is provided by or is within the Infinite's conception. Man can only reverse the process himself.

Figure 20 shows, oversimplified, the formation of the 3D vibration from the 4D cyclic oscillation. We see that the vibration separates more towards 3D, each motion of positive or negative goes further away from the central position of unity, equilibrium or balance point. There is also an oscillation from 4D to 3D (vertically) which is in harmony with the 3D oscillation and, in fact, creates it.

Figure 20

It is impossible to give one diagram to illustrate these higher-dimensional properties clearly. The vertical line is 4D all the way along it, and is in the equilibrium point between the positive and negative. The 4D positive and negative is not the same as the 3D positive and negative. This is a difficult concept which we come across repeatedly and consequently it should not be labored at this point. This 3D positive and negative split of the 4D unity enables the opposite characteristics of life to exist independently of one another - good/evil, love/hate, one extreme reaction/other extreme reaction, enthusiasm (as an effect)/grief, etc.

All self actions of the ego are created from one side of the 3D vibration. Any action or concept containing only one side, will incur the opposite side as a potential and it will eventually have to be expressed. The harmful act, where injurious physically or mentally, whether great or small, is a one-sided expression (it cannot be expressed in harmonic 4D energies) and it must be balanced. The karmic consequences are a reversal of the flow and exactly what one does to another (in terms of energies) returns to self (see Chapters 18, 19 and 20).

MECHANICS OF THE 4D TO 3D EXPERIENCE

Relevant to this chapter let us summarize some of the characteristics which relate to this 4D to 3D dimensional gradient, that is, existence at different levels as we come down from 4D to 3D. We shall gradually come to understand these aspects throughout the book - in particular, the appendix fills in some technical details which the technically-minded reader may make use of. Thus the changing properties as we come down the scale are:

- 1) Density of matter and space increases - consciousness is less in tune with them and there is little psychic ability.
- 2) Space will decrease (as a subjective experience) but will increase objectively (it will take longer to cross space - see appendix).

- 3) Time will increase objectively, and decrease in terms of subjective but real experience - meaning less control over time and less mental span of time.
- 4) Less unity of the opposites or greater separation of positive and negative.
- 5) Truth, which is relative, is less. The 4D unity carries the **whole** truth but since this splits into two qualitative and quantitative components or poles, positive and negative, then existence within these vortices of separated poles carries partial experience, truth and concepts, dichotomies, emphasized genders, etc.
- 6) The universe forms along with its opposite parallel antigravity universe. Our universe experience is on one gravity side and we do not detect antigravity. Gravity is spatially experienced but antigravity which, on the other side, is gravity and spatial, is experienced by us in time at the 3.0D level - Figure 21 refers (see appendix).

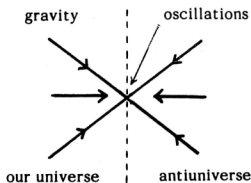

Figure 21

THE PHYSICISTS' DILEMMA: CONTACTING THE INFINITE

Nuclear physicists in studying the atoms and subatomic particles of the micro world have long since been encountering the multidimensional nature of consciousness. Classical physics, which might be referred to as conventional physics, and which is based on a three-dimensional framework dealing with the reality of the physical senses, cannot handle the explanations required by the "weird" observations and results of the minute world of subatomic particles.

Classical physics works fine for the macro world but quantum mechanics is more successful in making predictions of the micro world, although much more difficult to comprehend conceptually. For the layman, note the difference here: the macro environment is the ego viewpoint of separateness but at the micro level we are dealing with waves of energy and the separateness dissolves. The ego is trying to handle something which is no longer amenable to ego observation. However, in spite of the inestimable value of quantum theory no one completely understands it. It tends to reveal abstract qualities and requirements of a different logic.

After the initial practical successes of quantum mechanics it became apparent that it had deep philosophical implications, but the task of understanding exactly what was happening in terms of a comprehensible physical picture was another matter altogether. Interpretations violated normal (Boolean) logic and physical explanations became wrought with contradictions, conflicts, and a seemingly never-ending debate followed amongst physicists.

In very abridged and simplified terms we can summarize these arguments. The culprit in the confusion

is that the electron is found to behave both as a particle and as a wave. The electron had previously been identified as a particle and it came as a shock to find it also behaved like waves of light. Thus depending on the scientific experiment the electron behaved as a particle or as a wave.

Now in attempting to resolve this dilemma as to whether an electron was a particle or a wave, detection of electrons as particles was attempted while a beam of electrons was behaving as though they were waves as revealed by their pattern on a screen; it was attempted to intercept them and detect them as particles. The type of effect on the screen was quite different for particles than it was for waves and thus whichever they were would show clearly.

Following the first shock of electrons behaving as waves, to the further astonishment of the experimenters, the **detection process** now revealed electrons as particles and at the same time caused the wave pattern to disappear, shown by the screen!

In other words, the process of detection of the electron was apparently causing the wave-like nature to change to particle-like. The implications of this were realized to be astounding. Thus the problem was that the electron had both particle and wave properties which was rationally contradictory. Classical physics could not explain this. The arguments continued as follows.

The phenomenon of the electron behaving both as a particle and wave defied classical, normal or sensible logic of the everyday world, and it would be necessary to use the weirdness of quantum logic, which was **not** very popular at the time. Alternatively to retain classical logic in the light of this wave/particle nature would mean introducing the interpretation that our interaction (the observer) in the experiment determined the particle nature - meaning, in general terms, that the observer is participating in the creation of reality! Therefore, on this basis, the world is not truly separate or objective, and the most basic tenet of physics - that reality is objective, meaning that it exists with or without man's observations (or perception) of it - is contradicted!

Thus having established the dual nature of the

electron, in order to retain common sensible logic we have to consider that man is influencing or creating his reality - by causing the particle nature of the electron (Copenhagen interpretation). That is, his consciousness in interacting with the system changes the wave-like nature to particle-like, and extending this to a generalization means he is creating his 3D reality from the basic waves of energy. All this is fine for the philosophers but shocking to the scientific academia.

Many physicists, to some degree went along with this and gave up the idea of objective reality rather than deny the logic. This of course, would sound like good progress to the occult or paranormal student. But Einstein could not accept the existence of a universe which lacked objectivity. He was in favor of a world which existed apart from man, one which was a pre-determined one and therefore considered that quantum mechanics was incomplete as a theory. Now if Einstein could "prove" this incompleteness then the subjective world would not have to be accepted since he will then have invalidated quantum mechanics.

In collaboration with Podolsky and Rosen, Einstein devised a thought experiment based on quantum mechanics which was intended to discredit quantum theory by showing that a fundamental axiom of physics was violated; that of local causality. Local causality means that widely separated events cannot instantaneously affect one another (no such thing as higher-dimensional unity, or whatever, between them); that is, information from one event cannot travel faster than the velocity of light to influence the other, and that there is no underlying hidden connectivity. This is what Einstein set out to show. In fact, our whole science is based on both the assumptions that our reality is separate (from the observer's influence) and objective, that cause and effect is local (in 3D).

Figure 22

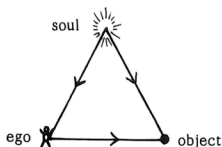

Figure 22 shows the ego-objective view of science, but the soul or higher self has the more true subjective view, as indicated, in which the universe is inside it. Note that psychic phenomena have no place in orthodox physics, and abilities such as precognition violates local causality since a future effect is observed before the "cause" has occurred (and to explain such a phenomenon one needs a different framework).

With the thought experiment Einstein was successful in convincing physicists that quantum mechanics was incomplete because it implied the presence of nonlocal causes, such as in telepathy; and instantaneous transmission of information via some medium other than 3D space. That is, quantum mechanics is incomplete since it validated these metaphysical notions.

However, contrary to expectations, the arguments of the thought experiment wove more intricacies and the very feature (of nonlocality or instantaneous action at a distance) which it set out to discredit led physicists to a serious acceptance of this seemingly metaphysical effect!

Next, Bell devised an experiment (known as Bell's inequality), the results of which left either of two alternatives: that the world was not objective (or more subjective - it was influenced by the observer) or was nonlocal with instantaneous action at a distance! As far as science was concerned both these alternatives had metaphysical implications and could not be explained. But according to Bell only one or the other was correct. Nevertheless, not all physicists agree with this, in particular, that the apparent influence in Bell's experiment of one polarizer on the other is not one of instantaneous action at a distance but due to a change in the relationship (error difference) between the two.

Whether the above, Bell's alternatives, apply we still have to explain the quantum weirdness - the apparent interconnectivity of isolated separated particles and/or the non-objectivity feature of the universe (the observer-created reality). And as we have seen, the quantum mechanical "weirdness" presents a philosophical physics which implies the existence of underlying dynamics at the micro level which relate to interconnectedness of three-dimensionally separate

regions or some hidden, unbeknown to established physics, unifying property.

A further influence to the arguments came from Everett's many worlds interpretation of quantum mechanics, which retains an objective world. The above-mentioned Copenhagen interpretation is one in which the future path or behavior of the particle is selected (for example, by interaction of the observer and electron) from many probable paths and this explanation supported the non-objective world idea.

However, Everett's many worlds theorem enables all the probable future paths to be taken - not just one. We only experience one in our universe but the others still occur in other universe layers (instead of the wave function collapsing to **one** path, as in the Copenhagen interpretation). Thus with Everett's theory it could be stated that nothing was fundamentally changed by the observer interaction since all the paths continued. Therefore objectivity is retained in which there is an observer for each world line, and each thinks he is the only one and selecting (collapsing the wave function) his reality. This idea of a myriad of probable paths or existences branching off every moment is covered as a reality by the spirit personality Seth in Jane Roberts' books.

Referring to Figure 22, the soul perceives the higher-dimensional whole, and all the 3D probable paths of the particle are within this, but not selected at this level. The ego viewpoint, however, is necessary to select from this higher-dimensional state, material reality, that is, one path by observation and interaction creating the 3D particle world. A similar situation holds for the soul's overall influence on the life of the lower self, which will involve a multidimensional situation even within preset specific goals. The lower self will be influenced in a certain direction but how he arrives there is his ("particle") selection.

Once physics recognizes that energy is transduced from the fourth dimension (and above) into our three-dimensional universe, and that different space-time conditions exist in these higher dimensions, then the quantum theory confusions will eventually be resolved. The fourth-dimensional energy gives us a third factor, a

more basic source, in addition to the simple ego/particle picture, for the hidden variables of quantum mechanics, and presents a framework in which areas of the third dimension, in space and time are spanned simultaneously at the fourth-dimensional level. Causation of natural events occurs in these higher dimensions projecting into the third a simultaneous action for third-dimensional sequences which only appear to have cause-and-effect properties.

The author's book **The Secrets of Flying Saucer Propulsion** outlines the higher-dimensional vortices underlying our reality, which will not be repeated here except to indicate that higher levels of unity (and frequency) are a natural consequence of these higher dimensions.

An even more surprising nonlocal effect than those discussed in the quantum mechanics arguments is the following example: scientific measurement shows that the velocity of light is around 186,000 miles per second and consequently light takes about eight minutes to travel from the Sun to Earth. If an imaginary screen is placed in front of the Sun, one would expect light to continue to reach the Earth for several minutes. However, if this screen is impenetrable to the high frequency oscillations of the Sun, the result of this barrier would immediately stop light from reaching the Earth.

The fundamental high frequency oscillations act virtually instantaneously across the distance to Earth. If this is blocked, invisible light will have nothing to ride upon and its existence will cease immediately. Thus we have apparently action at a distance.

Gravity is instantaneous since it acts perpendicular to our three dimensions coming in from the fourth dimension and going out, back to the fourth. This does not mean that gravitational waves travel instantaneously. As with visible light their 3D aspect obeys the 3D laws but the 4D aspects will be instantaneous.

Regarding the riddle of the electron exhibiting both wave and particle properties, we favor the observer-participator relationship. Ego consciousness is simultaneous with the particle view of the wave. That is, the ego 3D viewpoint is created at the same time as the

particle 3D state - one creates the other. Our consciousness interacts with reality causing the wave phenomenon to reduce in dimensions and manifest the 3D-particle view. In turn, 3D actions feed back information, moulding the ego.

In a subtle way, creation of the 3D effect from the higher-dimensional experience occurs in artistic appreciation. If one observes the sound of music intense enough, the music is not perceived at that moment. The ego is just hearing physical sound (there is no music in 3D) - the unity, or 4D aspect of the aesthetic waves disappears just as the wave nature of the electron disappears when it is observed directly.

We can see from this that by being too logical or applying 3D logic to incompatible situations - ones which are transmitting information from a higher dimension - or analysing too much, the truth or higher-dimensional aspects withdraws and we are left with mere mechanisms and the particle arrangements. The materialist creates his believed viewpoint by moving down to that level. The spiritually-inclined likewise creates the higher viewpoint and sees that.

If and when quantum mechanics is ever completely understood we may find that it does not validate non-locality and instantaneous interconnectivity, or the theory of countless probable worlds one of which we select, or at least that an objective world is not part of the interpretations. However, it will not alter truth. There is already considerable evidence for phenomena of this nature - subjectivity, instantaneousness, and interconnectivity - but it would be satisfying to find an acceptable physical theory such as quantum mechanics from which such a reality could be derived, giving us actual scientific and mathematically validated proof.

FREEWILL: ILLUSION OR REALITY?

This is another question which is not answered by man's simple dichotomies "yes" or "no." Whether man has freewill or not has been the debated issue of philosophers for thousands of years. In our civilization it was never apparently resolved among academics. Materialism or predeterminism has been pitted against vitalism with endless arguments and is inevitably insoluble at the three-dimensional level only.

MATERIALISM VERSUS VITALISM

Materialism or predeterminism presents the general or traditional thought of academicians, and refers to a world which is governed by the laws of action and reaction, law of entropy, a closed system, etc. - meaning in layman's terms that everything is determined by past, is preset, automatic, cannot be changed, free-will is an illusion, there is no true creativity and no added energy to the universe, and the universe is running down its potential energies, etc.

Vitalism refers to a vital creative force either from man's consciousness, cosmic consciousness or God, with the consequence that the reflexive and automatic functions of the universe, and man's mind and behavior **can** be changed, theoretically at any point in time. As a result of man's thoughts, intervention within existing physical universe events can occur whether through man's mind or God, giving rise to freewill behavior.

There are countless traditional, philosophic and scientific arguments swaying materialism versus vitalism one way and the other, but none of these will ever resolve the problem. Nevertheless supposing the debate is exhausted of all (3D) possibilities and maximum logic brought to bear on the data and factors, the probability would be that vitalism would prevail - that it would be

concluded that man truly has freewill. However, as one delved still deeper into the subject, made observations and experienced life, many doubts would still arise. There would still be key elements missing.

NEEDED DEFINITION OF SELF

The problem is pin-pointed by asking what do we mean by "man." Do we mean the lower self or the higher self? Freewill will be fully valid and effective at the highest level of consciousness but the lower self - man, the ego consciousness, in a physical body - has limited freewill, **depending** on his karma or preset programming for a particular life span. Freewill is relative.

His higher self or soul has, in cooperation and collaboration with other beings, guides, guardians, etc., predetermined a framework for a life which involves certain goals, positive and negative experiences, tests of spiritual behavior and spiritual reactions, and specific problems, all with the purpose of improving the soul.

Man, through his past lives will have already incurred countless flaws in his soul body which is then given an opportunity to remedy these defects by expressing them outwards in the 3D worlds, in a physical body. This has been covered in the chapter on Karma.

Now decisions may arise at the ego level or the higher self (soul). If a decision at the ego level contradicts a preset "script" for the ego made at the soul level, the ego will, in general, fail. But there would be exceptions where either the soul level was not greatly integrated and therefore weaker, or the ego was particularly strong and also acquired reinforcements from negative forces, thus overriding the soul's decision. Such a result would incur more karma for the individual.

Remember, this ego decision may be positive (to it) such as the goal to be a leader or to acquire wealth. But the soul may have preset the avoidance of such life patterns in that particular life.

It is thus desirable and ideal to recognize these preset decisions and allow the ego to blend and harmonize with the thoughts of the higher self (easier

said than done). The ego will **never** desire to do this, however, and will fight soul decisions with its life. In other words, the ego, that is, the extended ego structures to the natural ego, has to be **gradually** annihilated! This is the overcoming of the physical-universe trap.

Therefore one can see how much the ego may be restricted in its freewill. However, the above is a simple outline and the matter is more complex.

The ego is not a self-sufficient entity in itself - it must be fed from higher-dimensional sources with aid from very indirect sources such as the sub-souls of astral entities and their associations, or any weaknesses or strengths from its higher self.

The ego may 1) happen to be in phase (in agreement) at times with its soul, and will thus obtain its positive result on a **positive basis** (basically desirable), or 2) as mentioned above the ego may get its own way when out of agreement with its soul, and thus obtain its "positive" result on a negative basis (undesirable). Example (1) is basically desirable but if the ego expands its 3D mind territory (ego inflation, etc.) as a result of its success then some subtraction from the positive result will ensue.

One can see how useless it is comparing one person's situation, problems, difficulties in achieving goals, etc. with another's. Thus the ego requires a source of energy which is basically higher dimensional but **it can** make decisions at the lower level and could determine the path of evolution of a civilization to a large degree, both spiritually and technologically. This is the case with the present civilization.

RELATIVE FREEWILL

Basically the **lower self** has freewill only when: 1) the ego decision, when it **succeeds**, does not coincide with the soul's decision (undesirable); (By succeed we mean the ego has its own way - which may result in eventual failure to the ego.) 2) the ego decision, when it succeeds, does coincide with the soul's, but did not originate with the soul (generally acceptable); and 3) ego and soul have a clear slate (in a particular area)

with no preset program from the soul or control from the subconscious mind.

Overall, since the lower self is a projection or offshoot of the higher self, it **is**, when free of the ego, a direct expression of the higher self. Thus if the higher self or soul is sufficiently integrated through many lifetimes, then it will have full freewill rather than requiring guidance from other levels, and if sufficiently developed in this way will make correct decisions, since it is tuned to the Infinite (full attunement would mean no mistakes could be made).

Thus we have: 4) the lower self has freewill when the soul and lower self are fully attuned.

PUPPETS OF THE MIND AND SOUL

Other factors which determine lack of freewill are aberration and programming within the subconscious mind, with or without reinforcements from subastral entities. These factors will act like automatic circuits and tend to take over the conscious mind. Thus in these cases behavior is robotic, and man becomes like a puppet of the subconscious mind. This is the most undesirable state.

In an entirely different sense man, the lower self, when inadvertently operating under the influence of the soul's program for the lower self's life, is controlled like a puppet. If he has accumulated considerable karma by taking the ego route in many lifetimes, then a point will be reached whereby the higher self applies enormous restrictions within the lifetime of the lower self. The lower self may appear to be jinxed as constant efforts, even of a seemingly constructive nature, are thwarted or limited. This is nevertheless a desirable or at least constructive state and should not be confused with the phenomenon of negative subconscious control - even though negative forces maybe used to bring about progress in this way by overcoming them.

One might add, what about **positive** subconscious control? The merit of this, which is an example of partial lack of freewill of the lower self, is somewhere between the above examples, the value of higher-self control and the negative subservience of subconscious control. Good programming of the subconscious can be

very helpful, since one already has a subconscious mind heavily programmed, particularly with negatives - hence one may as well have good positive programs. But ultimately there should be no subconscious influence.

MECHANICS OF FREEWILL

The actual mechanics are more complex owing to the fact that freewill of lower-dimensional man exists only in relationship to his higher-dimensional self. The decisions and influences from the higher self act higher dimensionally monitoring a broad span of space and time - even as a unity. For example, a positive force may be transmitted influencing the lower self towards a better career. The lower self will have freewill within this limited framework. He will tend to be observant of factors - such as new opportunities - which are in tune with the soul's program concept and unobservant of factors which will distract him from the concept, and in general will experience a bias toward the fulfillment of the higher self's intention. Relevant items within the program concept will tend to be **attracted** into experienced events, ones which may not in themselves, as parts within a whole, be **specifically** (item by item) determined by the soul (or whole). Of these many items attracted into experience, the lower self will have a degree of freewill in choosing which to accept.

For example, an outstanding career opportunity may arise for an individual. He may have applied no effort at the lower-self level and everything may have been organized at the soul level. However, this overlayer of influence from the higher self, while acting could have been picked up by the lower self and the lower self is inspired to seek out or think positively towards the career opportunity. When it happens he may well consider that he (the lower self) caused it! But he is sometimes puzzled when an analysis of the events indicates that this could not be so. A simple example: he receives a letter highlighting the opportunity **but** realizes the letter must already have been in the mail when he made the positive thought. Thus again this is an example of the illusions we experience. In a sense he did cause it, but not at the ego level.

In another circumstance, however, the effort by the lower self might well have been necessary to catalyze the fulfillment of the higher self's program concept, where space and time permitted.

Thus a deeper implication of the difference between materialism and vitalism not generally recognized is that materialism describes reality from the parts (of the whole), as does official science and psychology, and considers the whole as secondary and made up of a synthesis of the parts, whereas the truth is that the whole comes first and the parts within the whole are secondary. "Parts" can be analyzed but in many cases, such as to some degree the atom, the parts do not truly exist but nevertheless produce an effect which partially explains the whole. Within this conceptual framework the ego determination is an example of the part making a decision within the whole (soul).

Regarding the future we see then that it is not pre-determined; in other words the future is not already there, in a sense, even at the highest level. Consider the oversimplified diagram in Figure 23. Higher dimensionally, point A spans both space and time at the 3D level. With this diagram, as B moves into his future C, then C, the future, should be known. However, Figure 23(b) would be more correct. Here we see many possibilities for B's path in the future. However, some paths will have a greater probability of materializing than others and can be predicted by psychics. As a final point, not only is this future path of B unknown at anytime but changes made in the lower plane may change point A. That is, the multidimensional whole is forever adjusting and becoming.

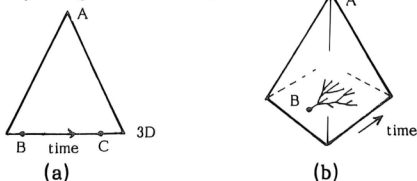

Figure 23

THE INFINITE CREATOR

We have already mentioned something of the nature of the Infinite Creator in the chapter on Light, that It basically appears to be an impersonal, unqualified Absolute of infinite potential and creativity. By this, we mean that it is not in Itself a personalized or personified identity. The Urantia Book refers to it as the unqualified Absolute, Tibetan Eck masters and the Eckankar knowledge, to the Sugmad or the Eck energy. We can also call it the **unmanifest** energy (the Eck energy may include the impersonal Light energy accompanying the **unmanifest**).

STRUCTURES OF LIGHT

It appears that this state of the Absolute and **unmanifest** energy is a prior or more basic state than the creation of the Light, from which all structures are formed. Basic thought or postulate moulds the Light, precipitating form from the unqualified Absolute from **unmanifest** to **manifest**, analogous to what the physicists would call going from the virtual state to the observable. However, we have to remember that this Light energy is an infinite spectrum and we only observe a narrow band in the relatively low frequency range called visible light. The **manifest** includes forms made from the whole spectrum.

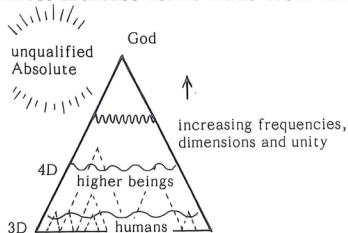

Figure 24

The pyramid gives us the best geometrical format for illustrating the spectrum of Light vibrations from infinitely high vibrations at the apex of the pyramid to lower frequencies as we come down into reducing dimensions, unity, and denser forms of creation. See Figure 24.

As mentioned earlier, the Light radiance is consciousness. In a state of propagation it is action of consciousness before integrated structures of standing waves (see chapter on vibrations) are created to form self awareness and identities, before the unqualified Absolute discovers Itself in form. Thus the basic state of the energy is the Absolute or **unmanifest** energy - this will nevertheless have total unity. The first **manifest** state is Light energy which is conscious action with no awareness of a self, just simply aware of its random but creative interaction. The second state is the results of the interactions (with Itself). These form identities from the standing-wave structures which are self aware, self conscious and represent stable states or identities created from changing (unstable) states of conscious action.

Below the fourth dimension, as we come down to the nature of consciousness in the lower material worlds, a third state arises in which the identities are separated, by 3D space, into physical centers within an environment. In effect, the identity is divorcing itself from its own actions (in the environment) and looking back on its surrounding space and time as separate, and as not of its responsibility. This is the much talked-about ego. This behavior makes the lower spectrum of consciousness' energies be separated and viewed objectively (perception of the material universe) which in turn reflects back on consciousness giving a lower frequency structure and validity to the ego and its existence. (It creates a linear world and viewpoint as opposed to a truly hierarchical and holographic one.)

A simple analogy would be likening state (1), that of conscious action, to the moving spot on a television screen which produces the picture (for the uninformed: the spot moves across the screen starting at the top left, is brought back and continues for 400 or 600 (or so) lines, then repeating again from the top - the spot

providing the color and light intensity. It does this so rapidly that a stable consistent and whole picture is viewed).

The spot represents conscious action (the first manifestation, above) and without guidance, that is, the synchronization to bring it back, its information would be incoherent; no picture would form the stable structure (second manifestation), or conscious identity, which could be the results of the soul's efforts, corresponding to the television picture. But for the ego (the third manifestation) we imagine that when the spot nears the center of the picture it creates a specific form (body). Now although there is awareness all over the picture, this center "identity," the ego, which is another self-awareness at 3D, fails to perceive the rest of the picture/environment except by physical senses, in which energy such as light comes into the body (eyes) rather than the awareness being out there. This ego denies its connection with the rest.

The result is an objective world, an environment **out there**, which would appear to exist independently of basic consciousness. In general, man has no idea that his consciousness creates the environment about him in a manner related to collective and agreed upon states but also created individually. This is one of his purposes, as a lower self, to cognite and recognize subjectively that he creates his environment and circumstances. On the basis of a linear world - the ego, religious and scientific view - rather than a hierarchical one the above statement about man creating his environment cannot be understood, since God also creates these things! There must be consciousness within consciousness, vortices within vortices, selves within selves, and creation within creation, and for this framework to be possible there must be higher dimensions and higher worlds. The linear view places items (atoms, man, Christ, God) side by side instead of within one another, which is hierarchical in a holographic manner.

This is the nature of the Infinite, and once this is acknowledged and understood all major mysteries disappear.

THE EGO VIEW

The previously discussed ego viewpoint and the earlier material involves information essential to understanding such relationships as that between Jesus, Christ, and God. By relationship we do not mean their personal relationship (although this will automatically follow) but what or who they are and the reason why they are closely associated. Also some familiarity obtained from the chapters on the unity of the opposites is highly relevant.

The ego can only comprehend by simple concepts of association, identification and separateness (and linearly). Present science is based on this level and as mentioned many aspects of such religions as Christianity. Logically, this is covered by Aristotle's three laws, which have become a materialistic impediment running through all facets of our education, thinking and organization. The ego viewpoint is that something either is (the same as) something else (in which case it is one and the same), or it is not something else (in which case it is different). That is, something is the same or different. It cannot be both.

This is the simple 3D human (ego) viewpoint and possesses no concept of withinness. The viewpoint is one which separates all things which are different and puts them in a separate region of space-time; for example, just as bodies or objects manifest at our level in separate spaces, God is considered out there in the sky or across space, etc. Everything is at the same level or within the same perspective and anything which appears to be the same cannot be different. Three-dimensional logic, which this is, is far too naive to handle even simple appreciation of the nature of consciousness. The dichotomies "same" and "different" have a gradient between them as do all opposites, and also can be unified fully, higher dimensionally.

We are mainly setting the stage for some understanding of the nature of consciousness or that of the Infinite's presence. Firstly, the spiritual hierarchy consists of different dimensional levels, each with complete laws but interconnected, with the ones above always overshadowing and capable of overruling the ones below. Each lower one is within the upper one.

Thus they are not overall, separate levels and yet they are separate at the limited viewpoint of any one level - except that the levels have **less** limited views and increasing degrees of freedom as we go up the hierarchy.

THE JESUS/CHRIST RELATIONSHIP

Before we discuss the difference between God and Christ let us first understand that Jesus was not Christ in the ego sense most people consider. Jesus was a perfected being of many lifetimes who was selected to receive the Christ consciousness and channel it; and **then**, as such, Christ was being Jesus, and vice versa. Jesus, from his soul level, would have agreed to this before that life. He then incarnated into a body in the normal manner. Later in his life, as a man, he began channelling the Christ consciousness or energies.

The soul of the man Jesus would be essentially cleared of impediments or disharmonies and the lower-self consciousness of the man Jesus would have been well tuned to his soul body, which means he would have been carrying out the goals of his soul completely in accord with the arrangement with the Christ. All souls of man including Jesus' are within the Christ consciousness and "fragmented" from it, but only a perfected being such as Jesus would be sufficiently harmonious in his soul body to become one with the Christ, and thus capable of expressing the Christ consciousness. Basically, every human being is part of Christ and is the Christ consciousness but because of man's negative states of out-of-phase energies we can say that the spiritual "distance" between man and the Christ is considerable, but unification is possible.

THE NATURE OF CHRIST

Now what is the relationship between Christ and God? We have explained God as being Infinite consciousness, All That Is, basically the unqualified impersonal Absolute, but personalized within this.

All things are expressions of the "One," the Infinite or God. An atom is basically a finite expression of the Infinite. Man or the Christ are expressions of the Infinite, given independence at their level. The Christ

consciousness is within God and is God expressing Itself through that form.

Figure 25

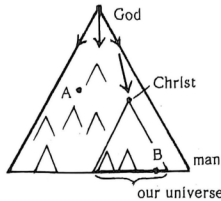

Figure 25 illustrates this in a very limited way (all triangles or pyramids could have their apices at the top - of the larger one - but as slimmer triangles since all originate at the top).

One can easily see how unnecessary arguments arise about whether Christ is God, etc. It depends on the viewpoint. Looking from some point A (Figure 25), God and Christ appear different; the Infinite can be seen to span more universes and hierarchies than Christ. But from the viewpoint B, both God and Christ are identical. The Christ consciousness is doing the Infinite's work in its area (as well as saying the Infinite is doing it). According to the Urantia Book the Christ consciousness is the Creator of our universe (one of many universes).

Now it may cause a strong protest amongst the religious but the extraterrestrials have described the Christ as an Office! All this would mean is that a section of God or consciousness - the Office - is available for beings to integrate with. There are many Christed beings who hold this Office who can, if needed, act as one. Remember that conception of this involves total subjugation of the lower ego viewpoint. Man is expected to evolve to be a Christed being - this is the goal of the Infinite for man. It means one is channelling the energy of this Office and is thus being God to that degree. All is one in different forms - all think they are different to the degree of the separateness (down the scale) and all think they are one to the degree of unity (up the hierarchy). However, identity is not lost within the One.

The ego cannot understand this since at the lower levels identity is different from behavior. On the higher

levels identity is synonymous with behavior. Identities could be considered as behavior patterns. Physicists, with the strong scientific ego are encountering the same problems, and are contacting the incomprehensible aspects of the Infinite. It is no longer a question of particles behaving (interacting) in a certain way but that the "particles" are an interaction (behavior pattern) - they are never separate. The ego causes us to identify everything as made up of particles having independent existence.

All that the layman has to realize is that fundamentally he is not an identity **apart** from others or the universe or God. The separateness is an amazing illusion but nevertheless gives us a learning process.

As a simple analogy of the identity/behavior problem, imagine a flowing river (consciousness) in which its bed of rocks and undulations (creative thought-moulds) gives rise to eddies, vortices, whirlpools - swirling regions of water which affect the whole flow. The eddies, vortices, etc. are interactions and not things or identities in themselves - they are made up of water (the Infinite energy) and are interacting. Thus the eddy or vortex represents an identity but is indistinguishable from a behavior or an expression of the river.

Such a limited analogy cannot remotely express the higher-dimensional characteristics, which can accommodate consciousness within consciousness without one level incorrectly interfering with another. This is handled by the increasing degrees of freedom of the new infinities as we go up the hierarchy.

Where faith is absent one can now see the logic in the statement that man can only be saved through Christ - this is only like saying the unborn child can only live and be born through the mother. There is no choice - unless one wishes to devolve to the lower dark worlds (which some do).

We can see that the Christ Office is not an easy concept to assimilate. The First Coming of Christ has been referred to as the Bestowal of a Michael on our planet Earth. This is Christ Michael, a Creator Son (not the Eternal Son - see section on the Trinity and Creator Son). This would represent the greatest expression of the Christ Office by reference to a single identity. But

even this would be both singular and conglomerate (with other Christed beings) but may be expressed through a dominant identity.

Now as examples of Christed beings on different levels and according to information from the spiritual hierarchy we have Archangel Michael, who is a lower aspect of Christ Michael, and who is the director of all spiritual activity of Earth. Note that Christ Michael is the oversoul of all humans and is the one normally referred to. A still lower aspect of Christ Michael or Archangel Michael is Jesus-Sananda, who appears to the Ashtar Command (spacecraft fleet concerned with Earth affairs) as Commander Sananda.

One may speculate, though probably accurately, on the identity Jesus-Sananda, or reason for the name, Jesus, in this context. The soul of Jesus was well evolved and subsequent to his exemplary life on Earth further unification or oneness with the Christ Office would be possible, thus now enabling him to be referred to as Jesus the Christ. To the degree anyone is manifesting the Christ consciousness, he is Christ to that degree. (Keep in mind the basic flow of energy/consciousness forming all things which is all God, the Infinite Creator.)

During the Second Coming of Christ, which is well underway, there will be many Christed beings. The principal one who will be identified as Christ is apparently now in body. Although one soul will associate with this body (as with Jesus), the Christ Office will operate with him as a conglomerate - the soul of Jesus will be included, along with other advanced beings and Ascended Masters.

The above discussion, in effect, describes the relationship between God and Jesus; it merely gives more information than saying Jesus was God incarnated. But the latter is not wrong. In particular, one could consider that before the creation of Jesus' soul God would have the plan to communicate at the 3D material level through a man. Thus in this sense Jesus' soul would be closer to God over and above the fact that all beings are finite expressions of God.

DIVISION OF CONSCIOUSNESS

We have seen something of the difficulties involved in understanding identities within consciousness. Consciousness has the ability to separate, yet not be separate, to operate as a whole yet still be the parts. It is necessary to stress that any attempt at verbal interpretations are limited. Our language will only provide familiar three-dimensional conceptions and can barely handle anything in the nature of the qualitative states of the higher dimensions.

In the book **Superhuman** we dealt in a simplified manner, with individual and collective consciousness showing the relationship between the whole and the part, and that consciousness not only splits up into parts but can also create relative wholes from the parts. Let us list these two features:

- 1) Division of consciousness: unity to separateness
- 2) Unification of consciousness: separateness to unity

In **Superhuman** we gave four basic passive principles: unity, separateness, enforced separateness and enforced unity. Here we are giving two active principles: unity to separateness - or **division**, and separateness to unity, or **regeneration**.

Number (1) above relates to the original creation of all conscious forms from the One and, in particular, the apparent decline of man's consciousness referred to as the "fall" of man. Number (2) relates to the regeneration of energy or consciousness (back into unity). By creating coherence from separate energies or consciousness we have the basis at the higher levels for the creation of new consciousness, and at lower levels for flying saucer propulsion, the mechanism of coordination of muscles, harmonic relationships between people, man's development towards greater spiritual levels - and even the true power behind the laser, etc.

Note that (2) is not the reverse of (1) which will be explained in Chapter 21. Here we are interested in (1), the creation, on a high level, of new conscious forms and obtaining some grasp of the enormously difficult concepts involved in understanding the Trinity (in its infinity). The best source of material on this inevitably abstract subject appears to be the **Urantia Book**;

Urantia meaning Earth. This is a book apparently written by higher members (than the human level) of a spiritual hierarchy. Amazing attempts are made to explain to man some of these abstract (to man) and impossible fully-to-understand creations and the spiritual administration of the Creators.

THE TRINITY

We will attempt a simplified interpretation of The Trinity (the Father, the Son and the Holy Spirit) and the further developments to which it leads. The basic state from which everything stems we are referring to as the Infinite Creator, or the Absolute. This state has complete unity but it is, in its original state, non-qualified and non-personalized, and which we have been referring to as **unmanifest**. It has infinite potential and utterly unimaginable creativity - even possibly to Itself, at this stage.

The Infinite Creator learns of Itself and discovers Itself in form by creating within Itself forms of consciousness to interact with one another, which integrate new unities, qualities and Beingness within Itself. These new states of unity may be more qualified or personalized than the original state and could be in category (2) above. These are **manifest** forms and are constructed from Light radiance. In the Trinity, for example, the Infinite Creator, to establish a qualified state (a quality of consciousness) of "Fathership" to all its "offspring" It creates a "Son." Remember these are merely humanoid, descriptive terms.

One may try to imagine the formation of an extension of the original state or Infinite Creator producing or representing the Son and then simultaneously within Itself will be formed the Father. A qualified state in the image of the relationship Father/Son has now emerged in which the formation of the Son automatically determines the existence of a Father personality (you cannot have one without the other - they are both parts of a whole). This Son is the **Eternal Son**.

Two qualified Beings, Father and Son now exist within the Infinite Creator and both are infinite; the Father having divested a part of Himself in the Son can

now act through the Son for various ministrations and creativities. The Father's personalized state is more existential (existing) and the Son's more experiential (acting). One cannot exist without the other yet from a more spatial point of view they appear separate. From an inner (Father) viewpoint they are the same - the Father is acting through a different quality of its own consciousness suitable for particular creativity.

We thus have two personalized unities from the unqualified Absolute. The next step is the combining or interaction of these states, Father and Son. Note that combining them does not produce the same state as the original one of unity which created them. This is a new level of consciousness - Figure 26. The harmonic interaction towards perfection of these separate states (Universal) Father (F) and (Eternal) Son (S) creates a new gestalt of consciousness; a new qualified state called the Holy or Infinite Spirit (I.S). That is, the achievement of "coherence" of the separated states of Father and Son regenerates within the fundamental unqualified dimensions of the **unmanifest** Infinite Creator a new state of Beingness, called the Infinite Spirit.

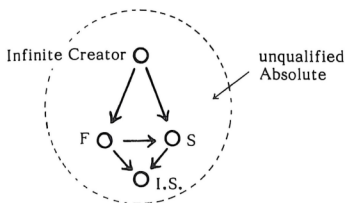

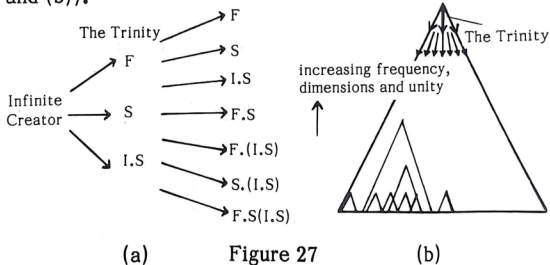

Figure 26

We now have the Trinity - the Father, Son and the Holy Spirit, upon which we shall expand. All three can (if needed) now act as a unity possessing certain infinite attributes which are not the sum of the three separate states, nor the same **after experience** as the original state but something else, something more. The condition "the whole is more than the sum of the parts" is the nature of a gestalt. Also the two, Father and Son can act through or as the third, the Infinite Spirit. But the Infinite Spirit is not the sum of the Father and Son.

THE MASTER SPIRITS AND THE NUMBER SEVEN

Now the Trinity, having been formed, bestows upon each state a uniqueness which exists because of the presence of the three. A combination of the Father and Son in the presence of the Trinity, that is, after the creation of the Trinity, is not the same as the combination of the Father and Son before the Trinity formation. Apparently, similar properties occur at the opposite, micro end of the hierarchy observed by physicists engaged in understanding quantum phenomena in which certain processes in quantum mechanics are non-commutative.

We now take all combinations and permutations of these three, Father, Son and Infinite Spirit. Seven new gestalts of consciousness are created; seven basic qualities or "personalities" which are now considered fundamental to all further creations (See Figures 27(a) and (b)).

According to the material in The Urantia Book this derivation of the seven states is the origin of the significance of the number seven. The seven unities of consciousness are referred to as the seven Master Spirits, each endowing different qualities to all further creations (of the Infinite Creator and Its extensions and combinations). The Bible refers to seven thrones.

This gives the basis then for the number seven, which has been referred to as a magical number and has widespread recognition as possessing multifarious significances: quantitative limit to instant visual perception (not more than seven items can be spotted simultaneously); the seven intervals of the musical

eight-note scale; the ideal pyramid of supervision - one supervisor to seven subordinates; etc.

THE CREATOR SON

We have seen how the seven Master Spirits are created from the Trinity. Another branch of creativity from the Trinity gives the Creator Sons, actually originating within and from the Universal Father and the Eternal Son. Thus Christ Michael, sometimes referred to as the Son of God, originated in the combined creativity of the Universal Father and Eternal Son, and was one of many Creator Sons. Paul mistakenly considered Christ to be the Eternal Son. Nevertheless, Christ Michael manifests all the Divine powers of the Eternal Son as though he (the Eternal Son) was operating for this universe - but only this universe (Christ Michael's domain).

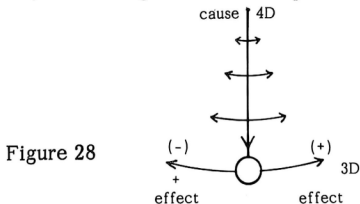

SUMMARY

We now have an idea of what is happening at the top of the scale of consciousness from which all lower forms of consciousness stem - see Figures 24 and 27(b). Going down scale from God to man there is increasing division and reducing dimensions and frequencies of energy and consciousness.

Our three dimensions basically form the lowest level for a physical reality since two dimensions do not form a suitable framework - it is a surface and exhibits obvious inadequacies. Figures 24 and 27(b) show the inwardness (upwards) of consciousness - consciousness within consciousness. It is hierarchical and there is organization (or unity) within organization (or unity) within . . . etc., of increasing degrees of unity as we go to higher levels of the hierarchy to the greatest personalized Being of God within the total unity of the unmanifest unqualified Absolute.

THE UNITY OF THE OPPOSITES

The factors of reality encompassed by this data are the most important in the book, and relate to man's exact predicament, his evolution or development, the true nature of the atom and its relationship with consciousness' vibrations, the problems of man, his karma and rebound of his actions, thoughts, etc. and the precise nature of his ego and its relationship with higher spiritual states. In other words, what life is all about. We have already dealt with this principle to some degree, and will again in later chapters.

The diagram of Figure 28 gives the basic vibration causing the above-mentioned experiences and reality. In actual fact, this illustration covers much more - which the layman can ignore, and which is covered in the technical appendix - and that is the relationship between gravity and antigravity, mass density, time and space, separateness of the positive and negative and the unity of the opposites, and the relationship of consciousness' energies with the physical universe, etc.

Firstly, Figure 28 gives us an initial introductory picture but of exaggerated simplicity (same concept as in Figure 20, Chapter 14). Imagine the pendulum swinging continually but with adjustable bob weight. At the lowest level (longest pendulum), which is 3D, the swing

is greatest from side to side, and the frequency is lowest. As we slide the bob up the shaft the frequency increases and the amplitude of vibration (the amount of swing from side to side) decreases. This is completely analogous to the nature of vibrations between the 3D and 4D, and the evolution of matter, life and consciousness.

Now this diagram only shows the change in the 3D vibration as it is raised to 4D and not the 4D to 3D oscillation. The reader should keep in mind what has been explained about vibrations in the chapter on vibrations.

The basic vortex (electromagnetic) vibration, which we are exemplifying here, applies to all energies from a subatomic particle to space-energy oscillations, to cosmic energies, to the whole spectrum of vibration which make up our consciousness, and also in an overall conceptual manner.

For example, let us take the theoretical 3.0D or most materialistic level of man's behavior and reality. Everyone wants to experience positive things only, in particular, wealth, good job, etc., and, in fact, to be made happy from these experiences (effects to self, not causes) - remember, there is nothing wrong with this, it is a logical behavior at this level and quite valid. This means the ego-reality structures of consciousness (actual electromagnetic vortex constructions) are oscillating at this frequency (3.0D) and are putting desire on the positive side. To the degree this is done the opposite side - as far over negative as the positive - becomes latent and must eventually express itself to balance the energies.

We have mentioned before that the positive and the negative come from 4D unity. All our opposites, good/bad, opposite reactions and concepts, etc., separate out as we come down the scale 4D to 3D (just as in nuclear physics, particles are found to have anti-particles). The more separate these become - lower position of the pendulum bob - the more we are conscious of opposites and bring these into our behavior, judgment and understanding of reality. For example, a person with strong likes and dislikes is operating very much on a reaction basis which is experienced and

expressed by the wider oscillation towards the opposite extremes.

Now when we talk about a good positive experience at the material level - anything to do with gain or advantages to self (that is, other than spiritual) we are referring to an ego-positive experience. We shall use this terminology "ego-positive" to distinguish this experience of self gain with simply a "positive" or spiritually positive gain - which could, for example, be a reduction in compulsions, a rise in vibrations, an increase in love and benevolence towards one's fellowmen.

Every experience of the material universes has two sides to it, the positive and the negative. Both must be experienced since they are already part of a whole. All vibrations reciprocate from positive to negative; the two sides ("halves") are presented alternatively in these lower, more polarized vibrations below the fourth dimension (see Appendix B). (The positive and negative are combined as a unity in the cyclic oscillation of the fourth dimension and above).

If one extracts the ego-positive and thus experiences only one side, the other, opposite one, is still present but not necessarily apparent within one's consciousness of the lower self. The vibration is unbalanced - it must seek the opposite. When the opposites are unified the waves are then tuned with those of the soul in a holographic wholeness. That is, consciousness has polarized the experience - given it the full polarity and linked the lower self with the soul in this experience (is oscillating with the soul - hence the word polarity).

One has to understand that one side is not good and the other bad. It is simply a condition of "half" truths as applied to each case. One side is a mirror-image form of the energy on the other side. It all depends on what is being defined. Put out a bad action and a bad action will return. Identify some things as bad, and the concept good will come into existence. Put out a good action and this will also return, but a good action, if pure, that is, contains no hidden motivations, is more spiritual, has greater unity and wholeness. That is, it is closer to 4D, the unity of the opposites. By higher laws the good is

decreed to return as with the bad on the lower levels. Thus unselfish acts have greater conceptual wholeness (truth); they are in line with the nature of consciousness or God and are not part of the lower 3D vibration.

However, all ego structures are made up of energies of these 3D wide-amplitude vibrations. These vibrations form a viewpoint with emphasis on self (ego) - the wider the amplitude the greater the ego strength. The positive and negative are most separate and not merging as they do in going up the gradient of 3D to 4D, whence they become more unified.

At this level one can imagine this as a circle in which the positive and negative are going round and aiding one another. The higher worlds, as we shall see later, are constructed of this type of energy.

Now the nature of these vibrations below 4D enable structures to be formed which are out of phase; that is, so that problems can be experienced. This is a difficult concept to put across but vibrations which are in phase, that is when both positive and negative of each, or many waves, come together at the same time or are multiples of one another, a fourth dimensional oscillation is regenerated which represents all the 3D waves as a unity. The more the positives and negatives harmonize (between 3D to 4D) the more emphasis there is of the overall unity. Without this unity or energy relationship, out-of-phase energies will exist.

One can easily see how this works consciousness-wise. As a person comes up this spiritual gradient 3D to 4D his consciousness is encompassing more of the environment and other peoples minds - this is much more than telepathy (thoughts are on a different level but could be tuned into). His self is expanding, also his control over space and time, but ego self is disappearing. The ego can only exist in a separate manner (since this is what the identity is) and operates very much on the part (not the whole) achieved by the fact that out-of-phase energies exist at this lower level. It computes on the bit and has no comprehension of true unity.

Now the above-mentioned regenerated 4D overall vibration which is created from the separate lower vibrations, not only applies to consciousness and the

mind but also to atoms in the physical universe. For example, the atoms of an advanced extraterrestrial spacecraft are all put into phase with one another (all positives and negatives together) generating a 3D-4D vortex of one very powerful positive and negative oscillation, which can be matched to the positive and negative oscillation of a planet - positives together (and therefore negatives on the other cycle) give repulsion away from the planet, or positive and negative together give attraction. This is one of the advanced methods of propulsion used by extraterrestrials (see The Secrets of Flying Saucer Propulsion).

As far as consciousness is concerned all we are stating is that as there is greater harmony between separate parts (atoms, parts of minds, etc.), higher-dimensional energies are regenerated (they already exist but take on a new pattern and polarization and integration) which unifies and connect to each of the waves at the lower level. This is how hierarchies of energies operate, each level has its own explanations, laws, completeness, truth, etc. but each is part of the other levels and part of a greater whole, and in which completeness and truth increases up the levels.

Figure 29

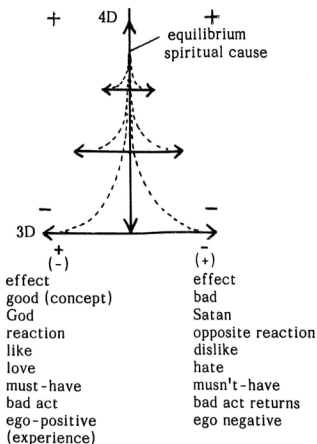

Figure 29, basically the same as Figures 28 and 20 but contains more information, summarizes some of the characteristics, qualities, behavior patterns of human consciousness related to the 3D oscillation. The dotted lines show that seeking the equilibrium point takes one into the 4D vibration.

Appropriate to the title of this chapter we might mention here the phenomenon of "soul mates," which seems to have accrued some confusion, or has incompleteness of data.

As per our two principles (Chapter 21) of unity to separateness, or division of consciousness, and regeneration or integration back to unity, we have two broad categories of soul mates based on: 1) an original split of higher-dimensional conscious unity into positive and negative genders, as with the original Adams and Eves, thus forming twin (half) souls (however, each can be regarded as a "whole" soul, since each could theoretically regenerate into the unity or wholeness), and 2) the separated twin souls go their own way and through constant interaction and attunement with any other opposite soul build a similar reality structure of frequencies regenerating a unity (whole soul) of their positive and negative (at least to some degree). Thus there is a natural (existential) twin state ((1) above), and an integrated (experiential) twin state (2).

THE PHYSICAL UNIVERSE TRAP

As it may have been gathered, the trap is within the ego. The extended compulsive 3D self-identity structures of the mind operate on the lower vibrations which are quite incompatible with the harmonic nature of the higher vibrations. Consciousness becomes moulded by these ego desires which are reactive and of a compulsive nature. The selves' "want" and "not-want," "must-have" and "musn't-have" are much stronger. To the degree that the ego wants or creates the positive side he will eventually receive the opposite in order for balance to exist. The positive and the negative are like halves of a greater unity and they cannot be isolated for ever.

The imbalances set up can be so great that it may take lifetimes before they rebound. An individual may have had a lifetime as a leader in which he exercised emphasis on self gain, enjoyed control of others, misused this prerogative and became dependent on this state of power, etc. His next life could manifest experiences of being treated menially and ignored, being a complete failure in the area of leadership and forced into humility. His soul before this life will have decided upon these experiences to counteract the distortions which the soul/lower-self has acquired from that previous life. The soul will program the lower self to allow these karmic experiences to occur. However, the number of lives already experienced may be relatively few and the soul will not be as strict, giving the lower self an opportunity to work things out, with obvious benefits from these efforts.

Now in this individual case the lower self may have too strong an ego which has too much say in spite of a favorable framework having been preset for his life.

Thus his drive for power is still present, and regenerates from past lives even greater heights of power, gain and selfishness. The ego structures build up - and also the trap. This applies to all experiences which create an effect on self. Let us take a milder example - that of happiness.

For average man, happiness is mainly an effect-state rather than a causative one. That is, he is happy because of things happening to him from the environment, from other people, etc; for example, he obtains a good job, is making money, receives respect, etc., and it makes him feel good. He becomes dependent on this more and more since we will assume in this example that spiritually for him there is little or no ability for happiness. He makes specific efforts to acquire things, or whatever, to make him happy. He is thus in a trapped condition which will eventually have to be broken down by his being prevented from experiencing these materialistic effects.

Ideally, one should be happy for no particular reason. This is a spiritual and causative state. The simple experiences of life and interactions with other consciousness could be sufficient for happiness but, of course, a person would have to be relatively free from specific problems. We see in Figure 29 that the 3D vibration is accompanied by effects on self but the 4D to 3D vibration is a causative one. This 3D vibration and its balancing expresses the main body of karma.

Karma is a natural consequence of the way these energies work. A bad act can only occur using lower vibrations or, in other words, causes lower vibrations to be experienced and recorded. One cannot commit a crime using harmonic energies since the higher unity gives perception of all areas such as another person's mind and it is experienced as self (oneself) or a greater self. A criminal cannot do harm to his victim if he has awareness of the victim's viewpoint. We are not talking about something intellectual or which can be verbally communicated to the criminal but a fundamental state of consciousness. Such individuals, in order to commit crimes, must have out-of-phase energies to prevent perception or experience of other selves (beings).

If a higher being, composed of cyclic harmonic

energies of consciousness commits an error, then the prior thought contained out-of-phase energies and then also the recordings and the action. He will come down scale to that degree. The lower vibrations express the error which will be one-sided; negative actions on one side, or ego-positive ones on the other.

Even in communication, the more specific one is in expressing fundamental concepts of life, religion, philosophy, science, etc. which is a type of communication positivity, the less truth there will be in the communication. The further over one side of the 3D oscillation one operates the less complete the concept will be. For example, to say something is bad or good expresses little information. There is a gradient between the two; they are relative terms. A person's self gain may be good (to him) but bad for others. An ambitious (materialistic) drive may be good one life (for a young being) and bad in a later life (for a developing being).

A lack of attendance in church or a petty crime may designate a person as a heathen or "bad" whereas possibly neither the term good nor bad describes the situation. Unfortunately Christians tend to take extremes, such as an action is either of God or Satan. No in-between states. This encourages thought at these low vibrational levels of computation in opposites.

This can be the source of tremendous problems, since it represents the maximum density of mass - maximum opposition of the opposing forces of vibration (see Appendix B) and the essence of materialism - very much in keeping with academic and materialistic science.

As we move up the scale of consciousness into higher spiritual states, the gradient between the opposites (dichotomies) is perceived more and the fact that there is a whole scale of values between the unity and ethics of God and Satan.

All these biased viewpoints are subtracting from unity and harmony and have eventually to be balanced, no one can escape them. As we have mentioned, some bypassing of karma is allowed in exceptional circumstances but these are major examples of significance and higher relationships.

If a person continues to create out-of-phase

energies by over-emphasis of self or harmful acts to others, his frequencies will reduce each lifetime and he will eventually devolve into the subastral planes. The reason why the frequencies reduce is that acts for self or of a harmful nature are energies which are out-of-phase; only lower vibrations can experience this out-of-phasesness.

Figure 30

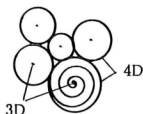

Figure 30 shows very simply the cyclic energies of the higher worlds or dimensions (that is the circles only - ignore the centerpoints for now). These cyclic energies are all locked into mathematical harmony and cannot express disharmony. Each experiences the whole. However, the centers of these vortices can express the dimensions from 4D to 3D. The center points can now be imagined as oscillating in and out, and each one can be out of phase with its neighbors, that is, vibrate at a difference frequency.

Thus the ego structure, the vibrations of a harmful action, or just matter and 3D space, are all created out of these centers. If the centers are increased in vibration they can be imagined as expanding out to become eventually 4D vibrations. The higher the frequency the greater the quality it can express (greater detail and greater speed). Also the higher the vibration the more this vibration is oscillating in further, additional directions corresponding to the dimensional level.

THE KEY TO ESCAPE

As we may have gathered from the previous sections the answer to man's predicament of escaping from the vibrations of the lower worlds, such as ours, is to operate at the equilibrium point in the 3D vibrations as they express experience, action and thought. This, of course, is far easier said than done. This is actually a "therapeutic" step well beyond the usual ones in which psychoanalytic or healing systems attempt to handle people's problems, aberration, neuroses and ills in general.

One cannot entirely separate even the typical problems of man from this development of ego structures, since many complexes of such problems are intertwined with ego expression and play a causative role in providing out-of-phase energies, which are conducive to certain ego extensions or developments. However, solving these typical problems will not necessarily rid the person of the ego drive and it is this ego drive which traps the individual since he usually does not wish to lose it! The ego is generally considered positive! This is the essence of the trap - not wishing to be free of these materialistic compulsions.

For example, a brilliant athlete trains all his life to break records - he is famous, respected, possibly even humble and generous. He has a life very much admired in society. Firstly, let us say there is nothing wrong with this; it all depends on the person's frame of mind - his attitude, compulsions and needs of his abilities. He may be a young being (has relatively few past lives) in which case his ego structures have not greatly set in and he is only just developing some of these needs and strong likes. However, after many lives, particularly ones in which he does the same thing over and over, the drive

for this type of achievement becomes compulsive - an extended ego-reality structure has formed in which his happiness depends on these experiences. The more reinforced this situation becomes the more he is operating on the ego-positive of the vibration and strives to retain this, and the more he must experience the opposite condition, if he is ever to recover balance.

Thus this highly positive life of this individual, which is an ego-positive, is actually negative relative to higher levels or relative to his own consciousness development or spirituality. Over these lifetimes all his actions which were good ones - ones which were not for self (spiritual positives) - would regenerate higher structures in his superconsciousness or soul, integrating the identity at this level, polarizing it more with the Infinite. But simultaneously he has been developing the lower identity in the form of ego realities - structures of lower vibrations.

These two identities become more opposed: one is of higher frequency, perceiving greater unity, and his attention is spanning more space and time, has goals which encompass spiritually beneficial effects to others and is seeking an established existence in the higher worlds without having the "ball and chains" of the ego, which is the opposing identity of the lower level. Both levels, however, interlace, one to the other, within the unity of the soul.

The conflict becomes more severe if these differences are not taking a more normal and gradual course of resolution by means of the lower viewpoint gradually coming up to the higher one each lifetime. The opposition may reach a point whereby the soul puts a stop to it all, once and for all.

Rigorous plans are contrived prior to the lifetime and involving assistance from other beings, guardians, guides, etc. The lower-self individual now comes into his new life with possibly little initial change. The same drives are there, as scheduled and, in fact, the need to be a great athlete may be even stronger, sometimes deliberately reinforced in the higher levels to exaggerate the abnormal circumstances. The athlete may begin his career but then encounters barrier after barrier preventing his success. He is endowed with as

much ability as in past lives, possibly even more, but he has been programmed to meet with sufficient obstacles to stop him - maybe the onset of a heart condition. (Note that such a heart condition though will be "available" as a negative area already, in his past - and thus also presents an opportunity to work it out).

The shocks, frustrations and intense disappointments set up subconscious conditions of recognition of needed change, and the negative experiences create mental concepts which begin to balance up the ego-positive vibrations - forming gradually the required unity of the positive and negative experiences. He appears to be having a life of negativity and yet quite the opposite applies - at least in the long run.

He is learning by misadventure, even though in this example he appeared to do no wrong in the first place. If only he had had the correct data all these previous lifetimes he could have arrested the onset of ego development. Even so, the chances are a person will not apply these principles until the effort becomes comparable to the desperation.

Let us make it clear that there is nothing wrong with this person's lifetime activities involving athletics. But what became a true negative over many lifetimes was his **spiritual attitude and reaction** to what he was doing. His frame of mind became more and more distorted - an obsession to win, athletics to the exclusion of all else, etc. All the pain which he later experiences in his thwarted goals, is presenting a framework for cancellation of his extended ego-positives. How he will respond to this apparent misadventure depends on his attitude towards such negatives. Blame, bitterness, an attitude of no responsibility gives no progress and the negatives will continue. But the individual will eventually adjust and he may not be aware how much his frame of mind is changing for the better as he goes through these discomforting experiences.

A young being who has not developed any great ego-need to become, say, a leader or even a president - that is, he has freedom of desire in this area - if he nevertheless does become president, then to prevent the ego-positive build-up, he must avoid wrong spiritual

reactions to his duties regarding privileges, power, control, altitude and respect, which are expressed in the 3D vibration as a displacement away from the equilibrium point of the vibration. That is, since his ego-positive is potentially so strong in his position of power - all these positive factors to boost his image, etc. - he must mentally and spiritually compensate by indifferent reactions to these things (the equilibrium point) or if this is not entirely possible then to create deliberately the opposite to the ego-positive. That is, he should humble himself to a greater degree than even the average person - to put himself in a position of ego invalidation and to avoid all snobbishness, superiority with no misuse of privileges, power and control, etc. Any harm, even accidental, which is caused to another because of any extended ego framework of his will store up an opposite, to return to him in his future as in normal karma.

This is what is meant by practicing the philosophy of the "no-thing", and the Buddhists goal of seeking the "middle path." From such wisdoms stems the saying "moderation in all things." However, simply preaching this concept may, quite understandably, not only irritate the recipient but give rise to definite protests from him. The data is insufficient for an understanding.

Thus the extended ego and its compulsive characteristics must eventually be annihilated, and then on this acquired higher spiritual level one should gradually let go of the natural ego which would then correspond to a state not of the material world.

It may also be discerned that this phenomenon of the 3D vibration and its swing away from the unity towards increasing partial truths is the basis of macrobiotics. This nutritional practice originated with ancient Chinese knowledge of the fundamentality of the Yin and Yang, and this concept represents the two poles Yang, positive and Yin, negative, setting limits to the cycle of changes and to which all facets of life can be related.

From this basic truth has developed the dietary system of macrobiotics in which foods have been categorized as positive or negative (or degree thereof), or neutral. Thus the ideal diet is one containing the unity of the opposites, either of foods which are

expressed by the equilibrium point of unity and wholeness in the vibration such as whole wheat, or foods which can be balanced by means of combinations of equal degrees of positive and negative foods - although the further away from the balance point they are the less unity the combinations will produce.

Whether all foods have been accurately classified in this manner is difficult to say. It is not easy to reconcile the very comprehensible and plausible concepts of Hilarion's material relating advanced diets of fruit only (when the body has been conditioned and vibrations raised) to the macrobiotic notion that fruit has extreme Yin properties and not recommended, except in non-macrobiotic diets of meat, as a balance with the extreme Yang of meat! This does not discredit the derivation of this system of nutrition of which its fundamentals are beyond our science, but that there may be errors in its classification of foods as positive or negative.

Regarding applications of this vibratory property to problems and positive thinking one can easily see that the advice to continually think positively, and mentally create what one desires, to achieve the result, is not so valid after all. It depends on the individual applying it and his stage of development. Generally, a young being will be more successful in finding correlation between deliberate ego-positive ideation (of his needs) and the materialized result, and/but vice versa that negative ideation produces negative results.

However, the being of many past lives (and) attempting to evolve and expand his consciousness will find that the opposite condition applies, that ego-positive thought creates the **opposite** result and vice versa a negative state will sometimes allow the positive to occur! (since he has experienced in thought - and erased - some of the negative imbalance). This will occur to a degree depending on his preset conditions for that life, but may range from the reversal of a fraction of the positive states to almost all!

MAN'S TRUE PURPOSE

In the chapter **The Infinite** we mentioned two active principles of consciousness, 1) unity to separateness, and 2) separateness to unity. We dealt mainly with the first one. Now the second principle is not the reverse of the first one. That is, consciousness within the Infinite does not simply divide and then the process reverse in which the fragments gradually unite towards the whole again. There would be no long-term purpose in this, other than mere experience. The process of development back to the soul involves interactions with other consciousness, learning, integration and polarization of energies resulting in a completely different and further development of the soul with greater individuality, personalization and greater integration within itself and within the Infinite.

In terms of simple energy principles man's emergence from the Infinite is as follows: Firstly, there was a manifestation of a collective consciousness for the human life-stream endowed with particular qualities; this is already a fragment from the Infinite. Next we have the formation of individual souls from this collective state. Note that this process is aided by introducing negativity (see chapter on evolution) to "wall off" the individual areas of consciousness preventing dependence on the collective state. We now have greater fragmentation of the Infinite (humans with souls). This all comes under the category **division** - the first principle.

We now see that the coming-together principle is not the reverse of division. These separated fragments (humans) develop considerable out-of-phase energies with other humans and the Infinite. The differences become great since individual progress or deterioration can occur in any area. The positive process now is for

these fragments to interact (communicate) and bring about harmony of their reality structures and personalities to create greater unity.

Whenever positive thoughts or actions are exercised, energies are brought into **phase** on this lower level of interaction. This corresponds to "being on the same wavelength" (see Chapter 9) which creates resonance of the waves or oscillations. This condition of **coherence** of separate energies has the remarkable property of regenerating energies; that is, higher harmonics up the scale of vibrations and consciousness.

The word "regenerating" is used rather than "generating" since the energy is already there, either **unmanifest** but potentially of the unqualified Absolute or **manifest** and not linked or coordinated to the lower level; or operating on both these states.

The regeneration sets up greater integration between the lower level and the higher one by means of energy coordination and polarizations. This gradually structures an identity higher dimensionally in the soul which harmonically links the soul to the lower self.

Thus the lower self has more guidance and increases its positive behavior regenerating further the higher energies. This is a principle in which coherence of energies within the third dimension creates vortices of energy fourth dimensionally (and above to a lesser degree), just as musical notes resonate harmonic notes at certain intervals of the scale. The advanced spacecraft of the Galactic Confederation use this same principle, as already mentioned. Coherence of the oscillations of the atoms of the ship, that is, synchronizing the positives and negatives of the atomic vortices, regenerates a fourth-dimensional **spiritual** counterpart of the 3D craft. This singular vortex has a fundamental vibration of complete unity (is a gestalt) incorporating within it all the information of the lower atoms - spatial location, vibration, spectrum and harmonics, but with no 3D space or time at this level. The vibration is also fourth-to-third dimensional. The spacecraft now travels by tuning this powerful high-frequency vibration to those corresponding vibrations of the cosmos.

This principle is the same as that involved in spiritual evolution. It is a much more common pheno-

menon than might be gathered. The powerful laser's energy is due to this property of cohering light waves in 3D regenerating a 4D vortex, etc. (not realized by scientists). The power of the laser could be proved to be more than the sum of the energies of the separate 3D waves (the gestalt principle - the whole is greater than the sum of the parts). Various mind activities, such as learning processes, in particular, physical coordination include this principle.

On the higher levels of the spiritual hierarchy groups of beings by harmonious interaction can regenerate a higher state of being which can become a permanent identity! Examples of this can be found in the Urantia Book: the six Master Spirits, products of the Trinity, created an effect which culminated in the personalization of the spirit Majeston.

In striving to improve ability in any particular physical coordination, or skill, that is, practicing or repeating physical movements one may not realize it but firstly one is linking and putting into coherence separate energy waves and oscillations creating a single oscillation or vortex to represent all the individual movements or parts of movements, and secondly over a longer period of training this general effort to improve the coordinated performance regenerates higher aspects to the learning patterns, which as they develop span more movements in space and time as a single concept (Explained in the Hidden Variables of Piano Technique and the Fundamentals of Skill).

All we are stating then is that man, on the lower levels is expected to seek harmony and create unity amongst separated areas, realities, etc. and in doing so integrates higher-dimensional aspects of himself - in effect, building an identity at this higher level. In other words, his behavior in the 3D worlds is determining his future whether it is positive behavior integrating a higher identity or negative behavior, disintegrating coherence within the Infinite and dropping to the negative planes. Positive behavior is anything which is for the good of the most factors, which may be anything from harmonious, helpful or considerate communication to major sacrifices for the spiritual good of many.

Eventually, when the negativity and karma of the

lower level is cleared up he can exist permanently at the higher state. In turn, in this dimension, he repeats the process in seeking a still higher order of harmony and unity, integrating beingness which is higher still in the ascending scale, and so on; overall a very simple principle and purpose. This is the same as saying the unqualified Absolute is constantly becoming, forever integrating forms within its unmanifest state.

The simple principle here, as we have stated in earlier chapters, is the holographic one, but not the man-made holographic 3D image energy relationship. Life is multidimensional and one should think of levels of unity (within consciousness and existence), each complete at its own level, but not as complete as the one above, ranging up to the total infinite completeness of all things as a single unity (God).

The whole is reflected in each of its parts, and man is apparently a sufficient part endowed with a spark of the Infinite such that total integration within the Infinite would be within his ultimate potential - but God would then be more than he was!

In summary, man's purpose is to learn to operate at the equilibrium point and ascend into greater degrees of spiritual unity and dimensions as described in this chapter, and also to learn that he creates his conditions of existence, and that all realities are true, whether physical, mental or hallucinatory (since they are all an experience of energy).

ADVANCED LIFE ON MARS AND VENUS

Cosmic visionary Ruth Norman of the Unarius Foundation informs us in her book **Mars Underground Cities Discovered** that Mars was the victim of a huge disturbance some 160,000 years ago, described as a Nova but involving the entry into our solar system of a body passing close to Mars, colliding with Earth, and destroying the continent Lemuria. We shall return to this but in the meantime let us take a look at contemporary science's information on Mars.

Scientists continue their age-long quest for the answer to the riddle of whether there is life on Mars. Even after a concentrated study of the planet over the past decade or so the answer is still not forthcoming.

Schiaparelli in 1890 found faint linear markings on the Martian surface which he called "channels." But Lowell described them as canals and proposed that their extensive and geometric construction implied the existence of "rare intelligence." Many further speculations and observations on Mars led scientists to believe that life on Mars was a reality.

In 1965 Mariner IV reached the vicinity of Mars' surface and transmitted pictures back to Earth. Fuzzy pictures revealed a barren planet with lunar-like craters indicating a surface unchanged in a millenium.

In 1969 two spacecraft were sent to Mars revealing still more austere and hostile conditions and the unlikelihood of life. Undaunted and far from satisfied, scientists lauched Mariner IX which went into orbit around Mars in 1971, but on the side of Mars not previously seen four huge volcanoes were apparent which dwarfed our highest mountains. Furthermore, a "Grand Canyon" was revealed some 3000 miles long and 15-20,000 feet deep.

Many geologists are convinced that the 30 mile-wide canals first seen by MarinerIX were formed by giant floods caused either by meteors impacting and melting ice under the surface of Mars, or volcanic activity. However, an immense amount of water movement is required to explain the massive rifts and plains.

From all the information obtained by the space probes scientists are little nearer to understanding Mars and, in fact, the geological material has seemingly posed even greater questions.

Now, the so-called planetary "Nova" which destroyed Lemuria affected Mars by dehydrating and devastating its surface. Nevertheless the civilization even then was sufficiently advanced and in communication with the spiritual hierarchy to receive prior information of the intruding body and prepare by building cities underground.

The nova was actually a manifestation in the third dimension resulting from higher-dimensional energies of a positive kind directed at the negativity enshrouding planet Earth in order to cancel it. The positive and negative energy interaction expressed itself in the apparent event of a so-called planetary body entering the Solar System.

Thus the Mar's civilization continued, and according to Norman's book the civilization is still in existence, underground. Taking into account other data, the indications though are that it is no longer in our dimensions. This question is not made clear, but this is supported by the fact that out-of-body visits (overshadowed by the spiritual hierarchy) have been made by Unarius channels from whence came much of the information, and also other sources such as the fact that the spiritual hierarchy directed the massive negative thought forms remaining after the destruction of Maldek - a civilization on a planet beyond Mars of which the fragments now are the scientifically unexplained asteroid belt between Mars and Jupiter - and attached it to Mars to keep it away from Earth.

If Mars had been inhabited this decision would not have been made. Nevertheless this is supposed to be the reason why Mars is known as the war-waging planet of somewhat hostile vibrations.

While on this interesting point another reason for Mars being associated with war is that prior to the destruction of Lemuria, Lemurians, using their space fleet, launched an all-out attack on Mars. The inhabitants were prepared and using a surprise strategy defeated the Earthmen. However, propaganda continued to the effect that, in fact, it was Mars which attacked Lemuria, thus giving Mars the reputation of being hostile.

In our context then it appears that this Mars civilization is no longer in our physical dimension. This would also tend to be supported by the fact that this civilization has continued for hundreds of thousands of years without destruction, implying great spiritual development has been taking place. And as we know from other information in this book, as the frequency of consciousness rises so the environment eventually passes beyond physical perception.

Nevertheless the existence of the Martian civilization is still quite physical and involving corresponding material needs of man. The "canals" of Mars are supposed to be the surface ground effects (or after effects) of the great interconnecting transport system tunnelling from one city to another.

A typical city was about one mile in diameter consisting of beautiful buildings and sculptured gardens, fountains, fruit trees, statues, murals and, in general, a horticulturist's paradise. The enclosed roof area of these underground cities appears as a sky with simulated twinkling stars - even a "moon" is revealed periodically during the night cycle, and for day-time, artificial sunlight is used. Transport is by shuttle craft or moving sidewalks.

These people have developed their consciousness to a high level of sanity, intelligence and love for all creation. Their bodies are described as about an average of 5 feet 6 inches and are similar in appearance to our Chinese race.

Advanced technology enables children to learn mainly by video with the addition of sleep learning in which a ray transfers knowledge subconsciously. Birth has an alternative process to the natural one. The fetus can be developed externally in special vessels if the

mother wishes. This has advantages by both the presence of visual communication from the mother, and also the enhanced learning process of the infant achieved by scientific means for absorbing information relating to the infant, such as potential abilities, past-life experiences and the present goals for this coming life.

The Martians can travel between galaxies in their spacecrafts but even with their advanced technology enabling them to travel hyperspatially it takes them years. Such ships as theirs may contain as many as 5000 passengers, although they refer to encounters with city ships from other civilizations containing up to one million people.

Martians, it is explained, did visit Earth and set up a colony in the Gobi desert. However, the primitives of Earth were found to be so backward and hostile that this Martian settlement was abandoned. Thus we see then that Mars does have a very advanced civilization but seemingly not any longer in this dimension.

Planet Venus presents a similar situation but is even more spiritually advanced and definitely not in our dimension.

The surface of this planet has always caused a mystery to astronomers, with its perpetual veil of clouds. The information given in Ernest Norman's book **The Voice of Venus** is that this blanket of vapor is not a natural occlusion. The surface has been shielded by Venusians deliberately by means of high-frequency energy, with aetheric condensation forming an envelope around the planet; the purpose being to prevent man's confusion in advancing science's possible detection of inexplicable elements and strange radiations.

There are, in fact, magnificent civilizations on Venus which exist at higher vibrations of the atomic vortex (see Appendix B) and correspondingly greater dimensions. This places their existence outside the material 3D band of reactionary energies and thus not vulnerable to the severe physical or 3D environmental conditions on planet Venus. However, all levels and dimensions interact and there will be correspondences between the higher level atmosphere and the physical one. But even at the physical level on Venus there is consistency, good behavior of weather conditions and no

snowy regions owing to the planet's axis not being tilted, as is Earth's, creating the seasons.

In higher-dimensional worlds, such as this, lower forms of life exist but there is no predatory survival or survival of the fittest. Nourishment is ingested by means of prana (cosmic energy) in respiration in the relatively lower forms, but in the more four-dimensional energy forms beyond the atomic configurations of the upper echelon of the Venusians' development nourishment is in the oscillatory contact or resonance with the Infinite.

These higher-frequency civilizations on Venus enjoy an environment of iridescent glowing beauty and brilliance of color indescribable to Earthlings: radiant opalescence of oceans, rich bounteous vegetation, crystal mountains, and harmonious animal, bird and insect life.

There are societies which are at different levels of the scale of consciousness and exist separately in different cities. In general, however, inhabitants will encounter crystal cities, fairy-like castles, forest glades, environments lighted by the perpetual radiance of the Infinite, kaleidoscopic and multivariegated forms of birds and butterflies, rainbow hues reflecting sparkling shafts of radiant light, and an invigorating "atmosphere" free from pollutant energies.

The lowest form of man on Venus is said to correspond to the wise adept or guru on Earth, and even a child's intelligence would outshine any bright human. To become an inhabitant of Venus - and there is no birth as man understands it - a person will telepathically, and from their standpoint, reach out spiritually, to a plane or place harmoniously suitable, then seek out a family and communicate their wishes. The family group, by means of psychokinesis builds a body for the new individual who enters into it. The participants become the parents who may have to replenish the body structure from time to time until the new spirit makes the necessary adjustments.

Structures such as buildings or one's own home are created by materialization through psychokinetic abilities. This gives rise to great variations in design or architecture. The more advanced cities are on mountain tops, and the least developed in the valleys or on the

flat plains. As we have mentioned these lower levels of consciousness are well above those of Earthlings, but nevertheless many of these beings still have ties with materialistic past existences and feel the need for corresponding experiences, such as eating.

Buildings may be enormous with extremely spacious interiors, although average height of the Venusian is not much greater than Earthman. Cities may present a beautiful array of domes, minarets and spires, thoroughfares adorned with plants, and blossoms befitting a horticulturist's dream.

The construction, positioning and shapes of certain centers are architecturally designed to filter and regulate influx of cosmic energies for meditative purposes and communication with other worlds or universes. In particular, Venus is noted for its dispensation and administration of healing energies and consequently is referred to as the mother planet for the Solar System and is the most spiritually advanced planet in our system.

THE HIGHER-DIMENSIONAL WORLDS AND HEAVEN

The higher-dimensional aspects of these worlds cannot in any way be expressed through our 3D concepts and language. There is, however, a gradient from lower worlds to higher ones and this enables us to extrapolate our appreciation from the lower to the higher dimensions. Now although this inability to express these higher states is to be expected, nevertheless it is understated in reports of experiences of these higher planes, astral or above.

If we imagine entering such dimensions, and imagine using higher-dimensional perception, etc. we do so from this (lower) level using 3D imagination and we envisage encountering the striking difference between these planes and ours, never to be forgotten. However, this strangeness of experience will tend not to exist. At these higher levels, the corresponding spiritual body is completely at home, perception-wise, and it tends not to notice anything that is additional to 3D existence in any abnormal sense, except in **quality**.

This is similar in dreaming - except that dreams are not as vivid perception-wise. The most extraordinary sequences appear normal - flying, switching from one scene to another, strange time scales, etc. On waking one then experiences the difference, but normal awake consciousness forgets the **multidimensional** experiences of the dreams and tends to translate what is left in 3D space and time terms - making the dreams appear even more 3D-consistent than they actually are.

This dream experience is a good analogy for the experience of returning to Earth after encountering the higher-dimensional worlds - corresponding events are remembered and automatic translation takes place but what cannot be interpreted remains distant and abstract

or forgotten.

It is thus necessary that the reader always leave his mind receptive and flexible, and realize he cannot imagine the true viewpoint since the ego is being used at all times in this imagination process and automatically relates everything to 3D. Complete coherence of concept and vision of these incredible worlds cannot be expected.

Much of the following information is based on various sources: Unarius material and other transmissions, Swedenborg, The Urantia Book and, in particular, a logical analysis - using higher-dimensional logic when necessary - combined with the theories of the vortex given in this text (mainly the appendix). Thus as mentioned earlier, references to sources of information will not always be specified as this could become complex with inexpressible weighting of selected data, and a distraction to the reader.

NEW WORLDS

We have already mentioned the Confederation of 33 planets including Earth but in which Earth is still not officially a member - the government establishments being unaware of the situation. Even if it were generally known, Earth still would not qualify; the predicted changes it must undergo into the New Age of spiritual renaissance are a necessary requirement for this membership.

Each planet has a particular human polarity, and each of these humans have been reincarnated onto respective planets to act as a channel for the spiritual hierarchy, also they have all now had their memory triggered of the plan set into motion millions of years ago.

The Tesla towers, one on each planet, will be used to radiate higher-frequency energies criss-crossing from one planet to another of the Confederation of planets, providing beams for rapid space travel. But a much more important and ambitious use of these towers will be to create planets of various levels of vibration providing for the reincarnating spiritual student a gradient of steps for ascension into the fourth-dimensional worlds and above.

Each tower contains a powerful electromagnetic oscillator and is located within an intense nodal point formed by intersections of vortices and magnetic lines and also the planet's node. This means a powerful attunement can be made to the higher dimensions - like a larger hole in 3D space to the 4D, to allow a greater influx of energy (to come into the 3D space-time matrix).

The beams of energy from these towers of different planets will intersect at various points in space creating strong nodes for the growth of planets (similar, in fact, to the way natural planets are usually formed). The frequency structure of these planets will be regulated so that some are closer vibration-wise to the Earth plane of 3D, and others to the higher frequencies and with more resonance within the Infinite towards 4D.

Thus a gradient of organized and integrated spiritual planes is to be formed so that the evolving individual, instead of having to make the big reincarnational jump from a 3D planet to a 4D spiritual planet, can reduce the number of his incarnations by using this gradient scale of ascension into the heavenly worlds.

Note that The Urantia Book spiritual hierarchy has something similar already available. We mentioned earlier the Morontia worlds which provide man after physical death, with made-to-order steps for his development and ascension into greater spiritual states. He will occupy each of 570 morontia bodies in his transition through the mansion worlds. Note that the term heaven has been associated with these seven satellite worlds revolving around architectural world Jerusem (mentioned earlier), headquarters of our local system of Satania - the first mansion world or satellite being designated the first heaven, and so on to the seventh.

However, before we refer to man's spiritual ascension let us briefly relate the Urantia Book's description of the physical universes' organizational relationships with the overshadowing heavenly worlds.

MORONTIA AND BEYOND

In the center of (what appears to be) All That Is, is

the Isle of Paradise, the abode of the Universal Father, the Eternal Son and the Infinite Spirit. In our terms, this is the most inner (or highest) region of spiritual development. Such an attainment is the far-distant destiny of mortal man. As we move out from the center to "lower" levels, revolving about Paradise are three seven-world circuits - sacred spheres of the Father, the son, and the Spirit.

Orbiting outside these 21 spheres is the central universe of Havona which consists of one billion perfect spheres of unimagined beauty, each one different. Man in his ascension will pass through each of these gigantic spheres, experiencing endless wonder.

Further out, around the one billion spheres, are two elliptical circuits of enormous dark gravity bodies. These invisible bodies enshroud Havona and Paradise Isle, separating them from seven superuniverses orbiting still further away from the center. The superuniverses are unfinished but will each contain about 100,000 local universes, in turn, each of which will contain about 10 million inhabited planets. Our universe, called Nebadon is in superuniverse number 7, named Orvonton, with a diameter of approximately half a million light years.

Note that this size is only about five times the diameter of our galaxy. Thus on this scale our galaxy would be much larger than one of the local universes. In other words, this celestial organization is quite different from that of our astronomers (maybe we should comment here that astronomers do not have the distances correct to distant stars and galaxies, etc. The incorrect interpretations of the Doppler Effect over-estimate these distances).

Our universe Nebadon is located near the edge of superuniverse Orvonton, and our planet Urantia belongs to the system of Satania of which Jerusem is the headquarters. One system embraces approximately 1,000 inhabited worlds, and there are 100 systems to a constellation and 100 constellations to one local universe. Surrounding the superuniverses are millions of new galaxies in the process of forming.

In the context of this book the inner worlds of this configuration, that is, as we move in, would gradually become increasingly higher-dimensional, with the

central regions beyond all space and time (the Urantia Book does not refer to higher dimensions).

All the headquarters planets are referred to as architectural and are heavenly bodies for spiritual sojourn of the ascending students, and in the seven superuniverses there are some half-a-trillion architectural worlds. Jerusalem, which we have mentioned, with its seven mansions provides for personality, mobilization, unification, and realization.

Ascenders next pass onto Edentia, headquarters of our constellation, Norlatiadek, which has 70 satellites of socializing culture and training. Following this the spiritual seeker attains Salvington, the capital of our universe Nebadon, which is surrounded by 10 university clusters each of 49 spheres, where emphasis is on spiritualization.

Ascension creatures (such as man) continue through further graded planetary steps to Uversa, headquarters of superuniverse, Orvonton. This great sphere, Uversa, of Glory, grandeur and perfection is surrounded by seven higher university clusters of advanced spiritual training. Each of these seven clusters consists of 70 specialized worlds containing countless fully-attended institutions and organizations of spirit culture of re-education, preparatory to the long journey to Havona and ultimately the Paradise Isle.

PERCEPTION AND EXPERIENCE IN THE HIGHER WORLDS

Now in addition to picturing higher worlds as being on a **higher** level, geometrically speaking, we must also reconcile this with the description of levels going inwards. Thus higher also means further in. Hence Jesus' statement "Seek ye the Kingdom within." Each point in our space can be imagined as opening up infinitely into the higher dimensions; the energy coming from these higher, more inner levels, and out of the point (and back in) to create our universe. This rate of in and out motion is basic frequency or vibration. Also a geometric study of the fourth dimension provides the explanation of this inwardness.

Our 3D identities, the egos, are exterior forms whose energies basically come from the inner or interior

being. In the higher worlds the interior is exterior, with the absence of the ego. Man, in the **material plane** can be two personalities, one governed by his outward behavior, and the other, the true inner state. In the higher existence everything is revealed; one's behavior and appearance is what one is. Thus aberrations would show as distortions of appearance. Lack of honesty, integrity, ethics, etc., would show structurally. This is the invisible world of material man now made visible.

Communication is by thought, and names for identification are superfluous. No names or labels are needed for the simple reason that no copies (secondary duplications) of anything are necessary; for example, a model of an atom is superfluous since a real atom can be seen and communicated to another.

In the lower levels we need names as symbols for labelling a person and to which we can refer and recognize, since the actual individual is not always if ever, being perceived. In the higher worlds, the thought of a person contains that person's uniqueness and is communicated.

At these levels, bodies are not atomic, the vortices described earlier are not spiralling into their centers to form a nucleus and the basis of an atom; the energies remain more in the cyclic or spherical state. There is no breathing through lungs but one could consider the constant tuning of the body and resonance with the cosmic or Infinite's energies is the equivalent action to regeneration of life through respiratory action.

There **are** corresponding perceptions to man's; visual, hearing, taste, smell and touch but the spectrum of perception does not have these divisions, which merge and overlap extending not only into much greater sensitivity but a greater range. Also these perceptions are experienced by the whole energy body. The complete holographic property is functional outwardly (the whole within the part). In the material plane this holographic unity is concealed behind the separated parts; the separate physical sense selects its particular energies or frequencies from the unified whole creating our five divided senses in different regions of the body as in the linear viewpoint of the ego (not hierarchical).

This holographic and resonant condition, one part

related to another and to the whole, also applies to the structure of the universes at this higher level. This gives a vibrant crystalline appearance with unimaginably rich qualities to all facets of experience; the structures of the environment, cities, landscapes, etc. are quite solid at this frequency level but would not be to material man's physical senses. However, a being, if so wishing, could go through any of these solids by frequency adjustment.

There is no dirt or dust; no out-of-phase separated fragments of this kind. Nevertheless, one would expect on the moderately advanced heavenly worlds, some minor source of minute fragments of out-of-phase energies "floating" around, occasionally present or created by beings failing to retain total positivity at all times.

The complementary spiritual nature of the male and female becomes more evident in these higher planes in which the unity of the two is more complete - is a greater self than either male or female alone can be. Such a combination is more powerful than each separately. Nevertheless, eventually each would expect to develop both sides of these characteristics (male and female), and permanently operate as a gestalt or single identity from both (each could do this - any previous one is **not** lost).

Light in these ascended universes is the radiance of God - more directly than stars or suns to material creatures (of which such stars are living logos). The Light increases as one ascends but one's perception is changing accordingly.

As an analogy for the harmonic relationship between the different levels of consciousness or heavenly planes, one could imagine man's first harmonic permanent contact with God as the twigs on a tree in relation to the tree. More advanced beings now represent the branches, and god, the trunk. One can see that the twigs cannot exist without the branches and trunk. This would represent an overall picture of the heavens, both regarding beings and environments. Hell could be depicted as consisting of broken twigs scattered randomly on the ground (in terms of energy relationships).

In the inner (or higher) worlds the spirit of man seeks its own level. This is done by frequency attunement, which is more or less synonymous with agreement, affinity, love and the expression "affection," used a great deal by Swedenborg.

In the **material 3D** planes such as ours individuals of widely differing development can exist in the **same** space and time framework, simultaneously (but not in harmony) because the inner state or self is **out of phase** with the exterior self. The environment and experiences in the material worlds do duplicate the inner self but in a material out of time/space manner (not by immediate energy attunement). In the inner dimensional worlds this is not the case. The **inner mind state** cannot exist in an **environment** of different frequency relationships. Negative individuals, with their energy distortions will experience pain if placed on too "high" a level. The harmony of this level will exaggerate their out-of-phase energies and the higher frequency will cause pain.

A simple subjective example for humans of an experience of mental discomfort from higher unity and frequency impingement is one in which if the person has some particularly strong hate or resentment (which consists of out-of-phase energies and low vibrations) and then tries to imagine love for those areas or persons which he hates, he will withdraw his awareness, experiencing some mental pain from the clash of the very high love frequency compared with the low, out-of-phase alignment, hate frequencies. This is enormously heightened in non-material worlds or heavenly planes; comfort is directly related to frequency attunement which is directly proportional to the degree of liking, love or affection the person has for **anything**.

The evil person will seek out worlds of his particular evil to experience equilibrium. This is a natural selection within the Infinite and it is his affinity requirement, which is the same as frequency attunement in terms of expressed energies. He **actually wants to be there**, although it is a necessity (enforced). Thus a being goes to where he is inwardly. This is why the basic vortices of the outerworld in heaven duplicates the inner world in man. The spirit attracts agreement which

is a level of harmony, or in the lower states, some level of disharmony (but agreement in disharmony).

Examine again Figure 9 showing vibrations (vortices) within vibrations (vortices) forming the universe. These same types of configurations make up man's mind and body. All is holographic. There is unity within unity, organization within organization, gestalts within gestalts, waves within waves, consciousness within consciousness with basic harmonic attunement between all parts. Each part is tuned by resonance (see Chapter 9) to the whole such that the whole "knows" each part uniquely and is reflected itself in each part. But the whole is more than the sum of the parts - it is higher-dimensional. The conscious Being of a galaxy is not made up of the atoms (only) of the galaxy.

Figure 31 very roughly gives a guide to these attunement principles in the higher realms. The harmonic structure of the being's mind and its degree of integration will correspond to his environment (that which he attracts). Remember that all the personal traits or qualities are contained in wave information in the vortices, as explained in the chapter on vibrations.

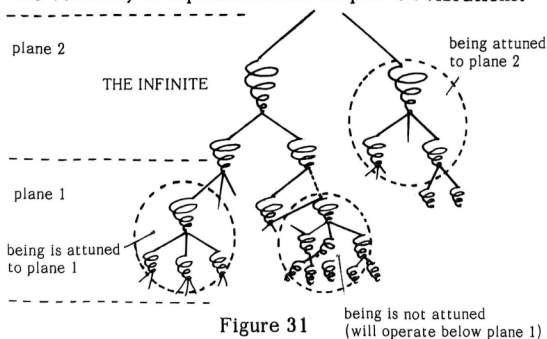

Figure 31

Both extremes, Heaven/Hell, positive/negative, have to exist for balance and give scope within which man must find the equilibrium point of free choice. He may be compulsively good (on the 3D positive reactive side), but this is not freedom of choice operating at the equilibrium point.

In the appendix we show how, as the vibration is increased towards 4D, space is unified more, in degrees of unification; also time. All these vibrations or vortices are basically of consciousness, and this increase in unity - to add to the skepticism of the purely intellectual - giving a particular degree of unity of consciousness, is affinity or love! The basic energy is love which, in a sense, is also the extent to which the same space and time can be occupied. We could say that the definition of love is the One self, God, the Infinite, All That Is, and any division of this unity in creating lower forms is a reduction of this love proportionately. But any original unity lost can be re-attained by the parts to the degree they are given this privilege by the whole (God). **Maximum** division with actual barriers of separation forms the subastral worlds of Hell.

Now we come to the concept of space and time. Let us consider increase in our perception of space and time as we hypothetically move from one level to a higher-dimensional one. At 4D and above, this concept of space-time and unity becomes inconceivable at our level. Our ego consciousness looks out from our body and perceives 3D distance between ourselves and an object, say, 50 feet away. At about 3.5D consciousness is acting less on the 3D vibration and more into the unity of the opposites or, in other words, more within 4D. The 50 feet distance thus appears proportionately less but in a more fundamental way than by imagining the distance as say 25 feet. Consciousness is occupying a larger sphere but this does not exactly mean that the first 25 feet have been covered and the object looks the same but now 25 feet away. The object itself will be more 4D and appear more complete in a totally natural manner.

This decreasing 3D distance is proportional to the individual's affinity or proportional to expansion of consciousness or the degree of attunement, etc. To some degree the individual will be able to look out of the space or objects around him but this will appear to be mental (as we would imagine now) and more of an intuition and knowingness, until the 3D distance is virtually nonexistent as we imagine moving up to the level of 4D where energies are of higher frequency, are

cyclic and in attunement.

The same applies with time. As we move up from 3D to 4D, the fourth dimension, which is time, converts gradually into space. Thus 3.5D means 0.5D of 4D time has changed into 0.5D of space, which means all of that degree of time (a certain span) can now be perceived simultaneously. But there are no discontinuities. It appears quite natural, and even more so than our 3D consciousness at our level.

The more spiritual a person is - in the **true** sense - the greater affinity or love he has, exactly in proportion, and to the degree he attunes to a level in the heavens in which everything is closer to him proportionately. Objective space and objective time (as we know them) become the same at 4D (and subjective but real) but there are higher orders of subjective space and time from 4D to 5D, and so on.

Existence at 4D involves no automatic and enforced passage of time, such as we have. Time is now 5D which is psychological time. There is sense of time in shifting one's attention from one sphere of experience to another - involving change of state or change of frequency - which arises simply because one thing followed another. There is no passage of time in a constant or repetitive state, nothing beating time in the background, whereas at our material level any repetition (even with no progress) still incurs objective passage of time.

For example, for us, just because the Moon repeatedly goes around the Earth, in the same space regions (seemingly), it does not mean that time does not flow from one repetition to another - we continue to age, for instance. Thus there is no time in 4D in a non-changing state - the time span is fully unified within 4D space and is a constant frame even though involving "repetition" of energy oscillations.

Now in these higher realms, to some degree, what one expects at these levels, in relationship to one's concepts of truth, past experience, intelligence, etc., will determine what one sees. Higher beings are seen by humans as human figures or at least as of a human framework and this is no illusion. In the not too high levels an energy body of this human form would tend to

be used permanently but at higher levels this would be very temporary and during communication at lower levels. The transmission-creation of such a form by the higher being (for presentation purposes) is not separate from the receptivity-creation of the lower being. One can see from this simple example the problem of communication between two different levels, including aid to lower beings (such as after physical death) of particular mental realities.

However, creatures of other civilizations of different bodily forms will see the form of their kind in these higher states. The multidimensional energies can handle it all. God could appear in countless different forms simultaneously to countless different peoples - proof of this is that he already does - everything is a finite expression of the Infinite. God is all things. We create **our** reality. Thus each person also creates his reality of God, and this reality would tend to be seen in the spiritual worlds.

Let us attempt to give a more specific example of consciousness in a fairly typical higher-dimensional environment. One may find oneself attending a gathering in an auditorium which can accommodate may be a million people. One of the features of the higher-dimensional planes is the enormity of some structures. Now one would be able to perceive the whole environment inside (the building) or out and all beings simultaneously, or focus on one small element (moving into it), or any degree between these two. Also one could look out from any point within this space singly or multiplicity - though none of this is imaginable to the ego. All present would have positive viewpoints and these could be experienced by any one collectively. The extent to which these experiences can be achieved stably will depend on the person's integration with the environment, other beings and the Infinite.

The precise duplication of another's viewpoint, or knowing another is experiencing the same experience, in other words, being on exactly the same wavelength (literally) - be it sense of humor, a particular quality, atmosphere, fine point of aesthetics, etc. - is normal experience at these levels and is an easily-appreciated enjoyment even by man at the material levels with his

corresponding experiences of this reality agreement phenomenon.

We described something of the beauty of the Venusian environment of spiritual worlds (when perceived by a consciousness at that level), and these are not considered high on the evolutionary scale. Obviously we soon find ourselves helpless with the mere use of our inadequate languages to express the beauty of the upper celestial worlds. Even a mere encounter with a fountain on a higher plane, referred to as planet Eros - related in an Unarius text - communicates an indescribable splendor of color, harmony and love from which harmonic reverbration of a type of sound emerges, teaching one, giving understanding, lifting consciousness into a state of oneness as it tunes the beholder into all the positive beauty and illumination from interconnected higher beings and the Infinite.

As is also evident from the earlier descriptions of Venus such existences and environmental experiences have correspondence to man's material levels even into quite higher levels; although these correspondences will "filter out" into pure qualities in these upper realms and be barely detectable or understood at our level. But all energies "run through" one another holographically and hierarchically.

From the descriptions of the environment and space and time effects of these heavens, if the reader finds himself reacting unfavorably to such experiences in higher worlds, then it must be stressed that the explanations are very limited and that there is no way he could be disappointed by such encounters (once they are attained).

Essentially, it is hoped that the reader draws his own conclusions, making use of the information in this book. Various areas should be expanded upon making use of the bibliography so the reader's reality can be increased, and self-determined decisions formed, but always keeping the mind flexible and allow for increasing understanding, recognizing that such an understanding of the concepts and reality of life and its full implication can continue to increase, seemingly indefinitely, as consciousness is raised.

APPENDIX A

DIMENSIONS

This will only present an outline of dimensional analysis since it can be an extensive subject, but it will at least help the layman to see what we are talking about when referring to the fourth dimension, admittedly in the geometric sense. However, it will inevitably go out of his depth, as it does for everyone.

Our universe and its space is three dimensional; that is, three directions, up and down, right and left, forward and backward, define our space. To obtain some familiarity with the relationship of different dimensions let us build up the picture starting with one dimension. To obtain a one-dimensional line we must move a point so that it traces out a line. To obtain a two-dimensional plane or surface we can move the one-dimensional line perpendicular to its length so that it traces out a plane. For three dimensions we move the plane of two dimensions perpendicular to each of its two dimensions, that is, perpendicular to the surface, tracing out our three-dimensional space or the dimensions of a solid, such as a cube.

One can now see that for the construction of four-dimensional geometry the three dimensions of our space must be moved at right angles to **each** of these three dimensions to trace out a four-dimensional configuration. This cannot be visualized or imagined in the 3D world with 3D consciousness. Countless 3D spheres can exist where one 3D sphere, in our plane, exists, but beyond it and not in our space. If one imagines a sphere of space contracting towards a point at its center, then regarding the fourth dimension, this imagined contraction can go beyond the point as though the point opens up into other space.

Just as a 2D surface, say represented by a sheet of paper, has 3D space on either side of it, so an object, say, a solid 3D sphere has 4D space all around it; not meaning around the surface of the sphere but around each imagined infinite point within it.

The fourth dimension describes our main time component and handles the first level of unity of cycles

(the fifth dimension will also handle cycles of a higher order). Anything which has a beginning and an end is perceived linearly at the 3D level, but at the 4D level the beginning and end are the same point (4D-wise), and merely begins again if there is repetition, such as in an oscillation, a wave, a life cycle or an orbiting body, etc. The fourth dimension does not handle the unification of the separated cycles. This is the way the universe is designed: an extension in one direction is accompanied by an extension perpendicular to that direction (through curvature). The fifth dimension, at right angles to the fourth, unifies the circles of the fourth dimension and handles repetition of 4D cycles. The fifth dimension will be the time it takes perception to go from one 4D vortex to another. This will be experienced (be noticed) in the fourth dimension and will be more of a psychological sense of time. Thus the fifth dimension gives the complete simultaneous path of any one actualization.

The sixth dimension gives all possibilities of the fifth dimensional actualizations. The implication of the fifth and sixth dimensions means that the infinite extension of the 4D circles will not unify the total universe (that is, in one large non-spiralling 4D circle). The sixth dimension gives all possibilities of the universe vortex simultaneously as a unity.

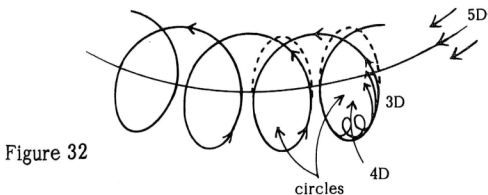

Figure 32 shows the overall relationship between the dimensions. For diagrammatic purposes 5D is reduced to 3D, 4D to 2D, and 3D to 1D. The 3D path appears linear to us and there is no perception of 4D and above. The 4D circles can also be within one another and spiral into the fifth dimension. The 5D circle (3D solid aggregate of spirals) can be considered as the sixth dimension and covers all 5D possible spiralling 3D paths.

(Strictly, we have run out of our dimensions and 6D should be given by 4D, which means the "solid" 5D should curve 3D-wise, not in a 2D loop, and "circle" back 3D-wise.)

The basic reason why "linear" space is curved is that each infinity for each dimension is provided by the next dimension. A linear 3D path actually curves into the fourth dimension, and the fourth dimension into the fifth, etc., resulting in spirals within spirals. If one travels (3D-wise and linearly) across the universe far enough and long enough one will finally return to the origin via the 6D circle.

APPENDIX B

THE MECHANICS OF CONSCIOUSNESS

THE FUNDAMENTAL PRINCIPLES

This section will deal with certain aspects of consciousness in basic terms and relevant to this book but will omit applications to material realities, since such applications form a subject in themselves and are dealt with generally throughout the book.

With sufficient education in the nature of consciousness one understands that basically consciousness is not of space and time. The materialistic factors, space and time, are ingredients set up by consciousness forming a framework for expression in material and structural realities. Basically 3D space and time could probably be described as out-of-phase Light vibrations; the out-of-phases preventing space and time from being spanned (resonating and occupying the same "space").

At the human level, space and time are unconsciously created and agreed upon, collectively, by humans perceiving in such a framework. By space and time, here, we are referring to three dimensions of space and a fourth dimension geometrically identical to each of the three of space but perceived one bit at a time, resulting in the experience of time (see Appendix A).

Within the fourth dimension and above, the concepts

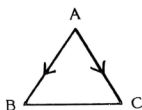

space and time are still used but they are not the same as the concepts of our normal experience of three dimensions of space, and time. For example, **relative** to our viewpoint, as we go towards the fourth dimension from the third, there would be a degree of simultaneousness of our objective space and time, and still more in further higher dimensions and of a different order.

All vibrations or Light are products of consciousness and thus space and time are constructs arising from consciousness; that is, consciousness itself is not of space or time and can exist apart from space or time. What we are leading up to is that this very feature of **no space and time** combined with **space and time** gives rise to the **holographic** properties of nature.

In its most basic form consciousness cannot be anything else but unified. However, as one moves away from this state towards space-time frameworks one can imagine, as a very limited analogy, consciousness as pooling or focussing or separating into regions but with the underlying unity still in existence - just like land or mountains visible above the sea; the sea level acting as the focus or level of reality and giving the degree of separateness of the land according to the water level.

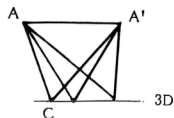

Consciousness naturally interfaces with its own space-time creations. This means that we have a unity of non-space-time "adjacent" to a space-time framework but enabled by means of a gradient between the two. The former, non-space-time consciousness, is qualitative compared with space-time which is based on quantity (of space and time or matter within it). The quality is not divided when spread throughout the quantity. That is, the full quality can exist at each point in space and time (providing no consciously created restrictions are imposed). In other words, the unified consciousness exists in each point of space and time. It is everywhere at once.

Figure 33 shows the type of interface to which we are referring. In figure 33(a) the triangle or pyramid illustrates the 3D objective state in that point A has no space or time yet it spans the whole of the space or time of BC. Point A can be regarded as 4D or higher and BC at the 3D level.

(a)

Figure 33

(b)

Now, Figure 33(b) is necessary to show what is happening here. This diagram (b) gives the more spiritual or subjective state in which point A, in Figure 33(a), is shown (in (b)) containing a magnitude AA' but one in which every point of AA' is everywhere else on AA' , demonstrated by projecting the whole of AA' to a point C in the 3D plane, where each point is separate from all other points but spanned by AA' . We see from this that the 3D level at C is quantitative but at AA' it is qualitative and cannot be diagrammed. Consciousness is thus represented by both A in (a) and AA' in (b) and we see how the triangle or pyramid format provides a geometry for the interface of a none-space-time state and a space-time state. Hence we derive from this the properties of the whole within the part, the gestalt nature of all things and the hologrammic or holographic relationships.

Note that hologrammic refers to the photographic plate (the 2D image) in taking a holographic picture of an object, and the term holographic is used to describe the 3D image created when the laser beam is shone through this plate. One of the special features in man-made holographs is that if the photographic plate is cut up, each part when penetrated by the light beam will reproduce the same 3D image. That is, the whole is within the part.

In general, Figure 34, similar to Figure 33(b) shows roughly this holographic relationship.

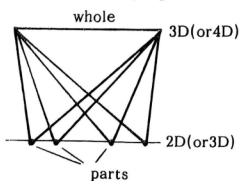

Figure 34

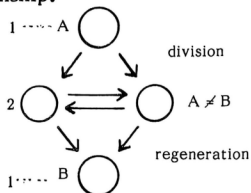

Figure 35

Now Figure 35 illustrates three stages in which a unit of consciousness A divides into two (but A still exists), then these two interact to create a further unit of consciousness B. The unit B is regenerated from the two parts and although directly related to A, it is not A. The original unity A has split into parts. These parts interact to create unity but in doing so regenerate a new unity B. This is covered more qualitatively within the main text of the book. Level B can be considered to be at the hierarchical level of A; that is, back up the scale.

Now the action of a unit of consciousness dividing brings about another level of unity of separation. Level 1 is a gestalt of level 2 and is more than the sum of its parts. General observation of this phenomenon and correlation of much data indicates that the division also brings about reduced frequency of the energies of consciousness. In fact, since the unity is reducing the amount of information or quality is reducing corresponding to a less "sensitive" wave, longer wavelength and lower frequency. In Figure 35, level (1) is thus considered "higher" than level (2).

In the next unifying and integrating stage the two separate parts, in creating unity from **their separate-ness**, regenerates a unity of consciousness B (Figure 35) which enhances the original state A, and occurs at level A. Unit B can be considered to occur within A. A is now thus more qualified and integrated; it has more properties, wisdom, abilities, etc. from its experiences in division and the interaction of its parts which did not have complete awareness of their collective state - and is now more "developed."

In summary, a unity of consciousness of the "whole" can divide into parts. The whole can operate through each of the parts but the parts have their own identity. At the level of division, one part does not fully know the other part of the whole during learning and development. Interaction between the parts regenerates a higher-dimensional unity greatly enhancing the original unity.

This is the fundamental principle to which we have been continually referring throughout the book in which the regeneration phase is one upon which is based the

ideal spacecraft propulsion, also coordination of body muscles and even, on the higher spiritual levels, the creation of beings (see main text).

In terms of energies or waves, coherence of separate regions causes a regeneration of the unity, higher dimensionally. That is, the waves are brought into phase, making them coherent, and waves of equal length will be locked together, and with fractions of waves mathematically and harmonically balanced or tuned.

This creation of coherence of separate regions of energies creates a unity between the separations forming a single vortex of energy higher-dimensionally. All energies oscillate into our 3D level in vortex form spiralling in and out of our physical reality creating all things.

THE VORTEX AND THE EVOLUTION OF CONSCIOUSNESS

The vortex has been described in layman's terms in the chapter on vibrations. Here we will extend the reality considerably. The vortex has an evolution, and this evolution, whether it is of an atomic vortex or those vortices of planets, stars, galaxies and universes, regarding the energy, is the same as the evolution of consciousness (all basically stems from consciousness and **is** consciousness). That is, consciousness consists of vortices which evolve, as does the vortex of an atom or planet, etc. Let us describe this.

All energy is transduced (stepped down) from the higher dimensions. We shall concentrate on the gradient from the fourth dimension to the third dimension. Energies in 4D and above are all cyclic whereas the whole character of our universe and consciousness occurs between 4D and 3D.

The energy of the fourth dimension has unity which applies also to **concepts** at the 4D level. This energy also has higher-dimensional truth than at 3D. In fact, in order that the energy converts into 3D it must divide into two components positive and negative. We now have two opposite energies, a two polarity system which forms the basis of all 3D vibrations and physical worlds. Conceptually, and spiritually, these opposite energies

are now each only "half" truths of opposite nature. This is the basis of all opposites, good/bad, the dichotomies, etc. The opposites are mirror-image forms of one another. But they form a whole when brought together at the 4D level. Note that this "whole" at the 4D level is not made up of two parts.

As a simple illustration Figure 36 shows, as an analogy, the unity of the sphere (a) split into two halves (b) which as one can see when joined (with no joining seam) do not form a sphere from these two halves. It is just a sphere. (The analogy is limited owing to oversimplification.) It is possible it could divide into three components forming a three-polarity system, etc.

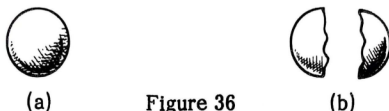

Figure 36

Now forget Figure 36 and realize we have two poles, positive and negative, for a vibration to occur. Let us recall Figure 30 again, in Figure 37(a), and if necessary reread the text.

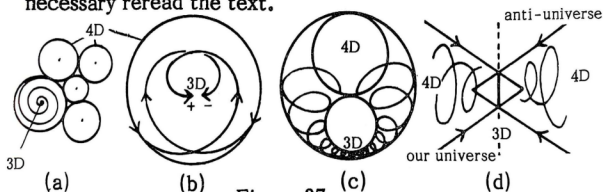

Figure 37

We see that the 4D energy spirals in from its cyclic action and oscillates in a 3D manner in the center. Figure 37(b) shows one vortex and gives more information. We see the two opposing spiralling flows, each alternating from positive to negative.

Now we come to the tricky part which is that our physical 3D viewpoint of the natural ego is on one side of this oscillation (because of its degree of separateness), whatever vibration we are experiencing or observing. Say, we are on the positive side of this oscillation in Figure 37(b), that is, we will take this side to be in

our universe viewpoint, then the negative flow is coming from another 3D space in the antiparallel universe. This is Dirac's negative sea of energy and the source of anti-gravity and antiparticles and about which he was correct, that complete symmetry exists.

In Figure 37(c) we see another view of the same vortex - the reader should attempt to translate one diagram into the other. Note that the spiralling energy truly curves into the 3D from the cyclic and 4D state.

We have still another view in Figure 37(d). We now have the oscillations more schematic. Our experience of 3D is just on one side of the line in Figure 37(d) of which this line (in this 2D picture) represents any point in space, for example, the center of an atom if we are talking about an atom.

The component of energy spiralling in from the left side in Figure 37(d) creates our gravity. The opposite component is also gravity in **that** opposite universe (anti-universe) but is antigravity relative to our side. It comes out of the point, but more of this later - compare particles and antiparticles, for example, the electron and the positron.

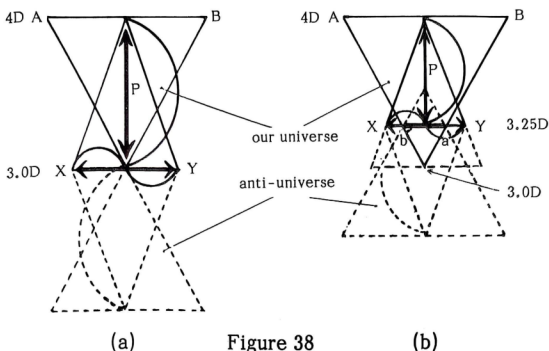

All these vortices have the same configuration except that the frequency varies, increasing from atoms through planet, star, galaxy to the universe frequency.

Having simplified the diagram we can now use it as an extension of those in Chapter 18. In Figure 38 we have turned Figure 37(d) through 90 degrees so that we now have the scale of 3D to 4D going upwards for convention. The anti-universe energies are shown dotted. Note that this 4-polarity system, 3D vibrations within 4D vibrations, is the same as that referred to in **The Secrets of Flying Saucer Propulsion** regarding the 4-polarity coordinate system of universes and anti-universes.

The arrow P shows the oscillation from 4D to 3D (the wave is drawn to aid visualization). Now the XY oscillation is the 3D vibration created by the 4D energy spiralling into its center (see other Figures)

In this diagram the 3D positive and negative swing of the oscillation is a maximum. This means the two sides or separated components from the 4D unity of greater truth and completeness are at maximum separa-

tion and minimum unity, which is 3.0D (logically).

This is the extreme ego state with its emphatic likes/dislikes, action/reactiveness, love/hate, judgement by comparisons and extremes, good/bad, God/Satan, want/not-want, have/can't-have, harm to another/harm attracted to self, etc. This is an essential part of the mechanism of karma. Selfish and harmful acts are vibrations emphasized on one side, incurring a latent opposite which eventually expresses itself by creating the mirror-image flow. The injurious outward overt action becomes a painful inward flow on the perpetrator but it is constructive since the oppositely biased waves will cancel the original ones still present in the person's mind. This cancellation will occur to the degree the ("negative") experience is taken positively regarding attitude.

Now study Figure 38(b) and note the changes from Figure 38(a) - the two opposites are uniting more. The 4D oscillation meets at 3.25D and has greater unity at this point which is represented by line ab compared with the point in Figure 38(a). We also see that the 3D vibration has narrowed its amplitude. Thus the ego potential is much less severe, with reduced extremes, compulsions, reactions, etc. The diagram also shows reduced wavelength or increased frequency (compare Figure (a)), but this will basically be due to increased

pressure between the components of the oscillation.

By extrapolating the diagram we can see that eventually the unity *ab* becomes the 4D unity *AB*, and the 3D vibration *XY* goes to zero. Envisage this happening in the other diagrams. In effect, aiming at the equilibrium point in the 3D vibration (moderation in all things, indifference (unreactive) and neutrality) attains wholeness and consciousness in 4D. The ratio of *ab* to *XY* is the amount of positive cyclic component in the overall vibration relative to the 3D oppositely directed oscillation.

In summary, as the frequency of the vortex increases:

3D → 4D
action/reaction → cyclic
ab → *AB*
separation → unity
3D vibration → 0

The vibration changes characteristics from a 3D oppositely directed force to a cyclic one in 4D with the unity of the opposites and harmonic tuning from one vortex to another eliminating 3D distance.

At this level, consciousness has transcended the ego. It has broken the boundary of self and expanded out, and can include other life forms and environment as its mind.

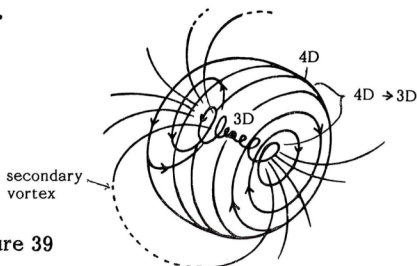

Figure 39

As a further reality let us refer again to Figure 37(b) and (c) but show the vortex in 3D (Figure 39). Remember, the true picture is one which is 4D to 3D and will need a lot of practice to visualize. No degree of imagination of the 3D can picture it entirely. Note

that the basic vortex creates magnetic lines which form an approximate duplicate of the vortex but its lines are more in the third dimension.

Thus our basic 4D to 3D vortex creates a secondary more 3D vortex in which its energy flow is perpendicular to the primary vortex. This flow may be referred to as consisting of electromagnetic or magnetic lines, or just electromagnetic energy, as with the primary flow. This primary and secondary oscillation is the same as those in previous figures where the 3D and 4D vibration is given.

The same vortex configuration is the basis of all energy structures of consciousness, of atoms, and the vortices grouping atoms to the planet, star, galaxy and universe vortex.

It is useful to simplify configurations such as in Figure 39 and, amazingly, higher-dimensional geometry can often be projected with a fair degree of representation using lower dimensions.

Firstly, let us show an effective and simplified way of illustrating the character of the vortex. Figure 40(a) shows the 4D cyclic wave. In (b) it is edge on, and in (c) we are coming down from 4D towards 3D with the start of the spiral.

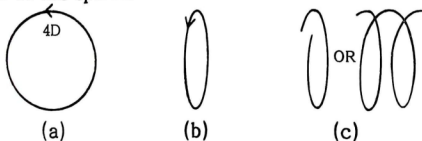

Figure 40

Now Figure 41(a) shows the more complete situation with the 4D cyclic energy unifying the two opposite flows, that is, with them inherent within this 4D wave. Reducing the dimensions from 4D, (b) shows the two opposing coils which have come from the two inherent directions of (a).

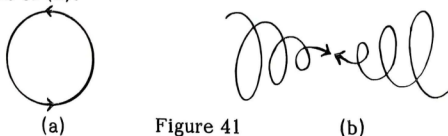

Figure 41

We can see that the more we stretch out the coils, corresponding to coming down the gradient to 3D, the more the configuration corresponds to two opposing arrows such as those in Figure 42(a). Whereas further up, more towards 4D, the spirals interact more and the opposing motions **unify** to a greater degree. They are less three-dimensionally opposite and can be expressed by a figure configuration (preferably imagined in 3D) shown in (b) at about 3.2D.

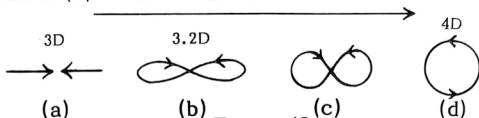

Figure 42

Further towards 4D we squash the figure eight as in (c). We can see that this illustrates less opposition by the arrows corresponding to reality. At 4D we can imagine the two coils merged together - although the arrows will be in the same direction and ideally they would be more illustrative of reality if opposed but recognized as unifying one another. That is, the ingoing and outgoing spirals are unified in 4D which we would envisage as being simultaneous. However, as we come down the gradient of 4D to 3D there is less simultaneity and the appearance of an oscillation. This concept of unification is important since it is the unity of the opposites and we shall be using this concept shortly in discussing the relative unity of gravity and antigravity.

THE RELATIONSHIP BETWEEN SPACE, TIME, GRAVITY, ANTIGRAVITY, DENSITY, FREQUENCY OF VIBRATIONS AND UNITY OF THE OPPOSITES

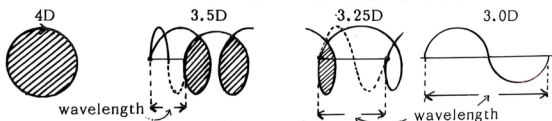

Figure 43

Continuing with the arguments of the last section, Figure 43 demonstrates how, as we stretch out the coil to give lower dimensions towards 3D, the **wavelength**

increases (also the pressure decreases and the rate of vibration decreases). Note that this 3D concept of the wavelength is a projection from higher dimensions as illustrated by Figure 43. In relation to the cycle the shaded areas are proportional to the dimensions, for example, 3.2D means that 0.2D is the fractional unity between 3D and 4D.

Now as consciousness evolves - collectively, so that the local space/time/mass vibrations change correspondingly - perception of space and time changes and also experience of gravity and mass, in addition to the inner changes regarding the opposites and the actions and reactions of the mind to life's experiences, already described.

Let us examine the effects on the experience of time. Consider Figure 44. We will begin with (a), our normal 3D experience. Point X on the wave is projected down onto the 3.0D line. All this shows is that any perception point X in present time is moving along with objective time at a fixed unchangeable rate - that of objective time. The gravity and antigravity flow have maximum separation and minimum unity. (The 3D vibration is not shown here.) This would correspond to ego consciousness' dramatizations of the 3D vibration at maximum amplitudes (separation of positive and negative). No intuition or use of consciousness in any way other than physical perceptions would be operating.

Now consider Figure 44(b). The energy spiral is higher-dimensional (it comes out of the paper as well as going along the surface). The shaded area justifiably represents the degree of unification of the two opposites. When this shaded area is spanned with consciousness there is no difference of time from point to point within it and no 3D space, as we shall explain.

We have projected the thickness of this area onto the 3.3D line, which on this one-dimensional time line demonstrates a span of time within which time is unified (length of arrow), and can, if desired, be experienced all at once. One must now imagine this whole arrow moving along in strict objective time. To simplify matters we have projected this arrow to a point on line A, so that it can now be seen that perception can either be 1) of a 3D point in time (normal) but which can

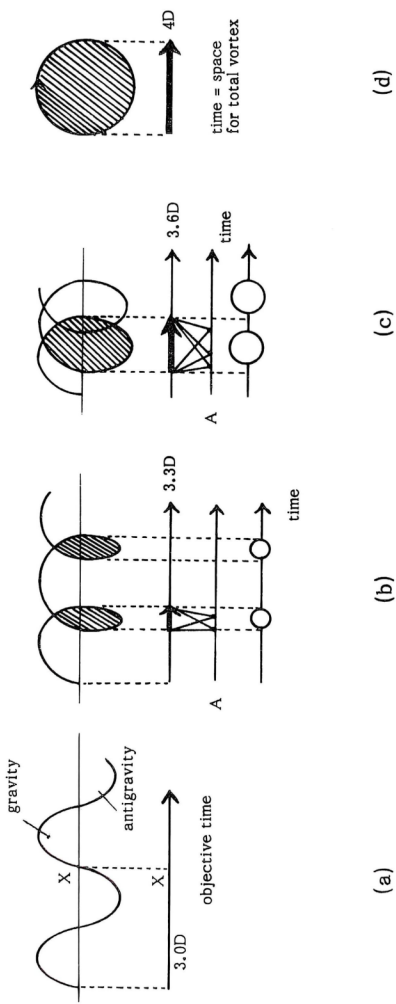

Figure 44

consciously be moved about this span of the arrow at will - a little into the past and future or 2) any degree of this (point) to the whole simultaneous span of the time arrow.

In the latter case, perception of space would be 3.3D. Everyone who has musical sensibility experiences 2) above, that of spanning a little 4D time (of sound) as a complete unity - otherwise there is no music. The mind commonly operates higher dimensionally in various subjects, particularly aesthetics. These unified regions are equivalent to circles of time on the objective time line, and they increase in diameter as we go from 3D to 4D, shown as a further projection in the diagrams, and total span of time would be the maximum circle but this would merge (curve) into still higher dimensions (see Appendix A). Similarly, Figure 44(c) spans more time, and (d) would give complete simultaneity of the time and space information within the vortex; whatever this vortex spans - it might be a lifetime.

Such experiences of consciousness are either a temporary, supersense-experience confined to certain individuals or occurring semi-consciously in various regular activities, for example, a learned physical movement is spanned simultaneously in space and time by the controlling level of the mind.

Now if consciousness of the civilization, collectively, increased in this manner, the surrounding universe would also change similarly. Atoms would vibrate at this higher frequency, mass would be aetherically less dense (since the oscillation is less at a point and contains more 4D space), and gravity and anti-gravity would be more unified, resulting in an effective and proportional decrease in gravity.

The first point we notice is that we only experience gravity and not antigravity even though the antigravity comes through into our side of the dual-universe situation. Why don't we experience antigravity which would, however, cancel gravity?

Consider Figure 45 - this is compatible with previous diagrams such as Figure 37(b). At the 3D level, the opposite 3D flow cannot occupy any of the 3D space on our side since our side is 3.0D and gives complete 3.0D space with the fourth dimension manifesting

entirely as time (fully objective). All the flows can be imagined as being projected into 3D including the overlap. But since the 3D space is complete at 3D then the effects of the opposite flows are fourth dimensional and only appear in time. That is, at 3.0D the antigravity flow projects into our space at 90 degrees to each of our dimensions.

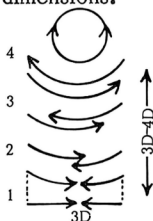

Figure 45

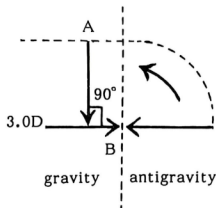

Figure 46

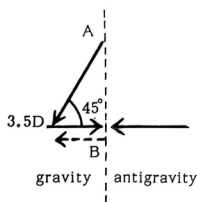

Figure 47

Figure 46 shows the antigravity component A perpendicular to arrow B representing our three spatial dimensions. What this means is that whereas gravity on our side has variation spatially but homogeneity in time, the antigravity effect on our side has homogeneity spatially but variation in time. That is, the antigravity component has no effect on gravity since it has unvarying force on our side throughout the vortex and acts in time. Note that there is reciprocation of space and time.

Now consider a consciousness or universe which is higher vibrationally, say, 3.5D, Figure 47, compare Figure 44 and Figure 42(c). Here our antigravity component A is at 45 degrees to B projecting now a spatial effect on B since the dimensions are greater (3.5D), B and A are unified to the degree of A's projection. The effect of gravity will be correspondingly less owing to this partial unity of the opposites, but strictly it is not a 3D cancellation. The effects on our time, space and perception are given by Figure 44 and related text.

At 4D the angle is zero and B and A are unified totally, resulting in zero gravitational effects (in both "universes"). All the space of the vortex can be spanned simultaneously or in fragments if desired, and can thus

be moved through instantaneously as a body, mind or spirit at the level. What was time at 3.0D is now space at 4.0D and is similarly spanned.

In discussing the relationship between the gravity and the antigravity component we have dealt with the 4D vortex coming down into the third dimension at its center. Figures 43 and 44 did not show the 3D or electromagnetic component which was, however, shown in Figures 38(a) and 38(b) in its relationship with consciousness and its behavioral effects on life. In other words, we have omitted it in the later diagrams pertaining more to universe physical properties as it was not required. Figure 39, however, shows this 3D component of electromagnetic lines of energy forming its secondary vortex with lines of force at right angles to the basic vortexial lines.

In terms of oscillations, Figure 48(d) shows the 4-polarity relationship of the electromagnetic component and gravity. The continuous line represents effects in our universe; the broken line in the opposite anti-universe. Starting at A, the 4D gravity oscillation implodes into, for example, the planet (or any vortex). This charges up the 3D matrix like a condenser, and as the 4D pressure reaches a maximum (point B) and begins to decrease, the secondary 3D component in the next quarter cycle discharges into the 3D plane 90 degrees out of phase with the primary wave. While this is occurring the opposite conditions to these are manifesting in the anti-universe. Beyond point C the 3D component has decreased and the antigravity component is operating in our side but has no affect except as time - see Figure 47 and text.

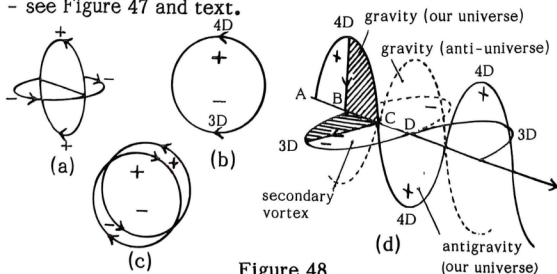

Figure 48

Now beyond point D, the 3D electromagnetic oscillation is in the anti-universe as a positive (but negative to us) and so on. Note that the gravity and antigravity oscillation four-dimensionally speaking are **both** positive but since one is the mirror-image opposite of the other relative to our universe or in the anti-universe relative to it, we can call one half cycle negative with respect to the other. The electromagnetic cycle is a much lower potential and labelled negative.

It may be noted that there is a 4-polarity system here: two 4D poles (gravity/antigravity) and within and created by these, two 3D poles producing the radiation spectrum. The cyclic 4D configurations shown in Figure 48 are a couple of ways of drawing these when including the 3D component even though it is displaced by 90 degrees.

In (a), (b) and (c) of Figure 48 all three diagrams are equivalent. Figure (a) gives the origin of (d) but strictly, in the fourth dimension the 3D cyclic oscillation will not be present - only potentially. Diagrams (b) and (c) show the unity of the opposites of the gravity and antigravity components (positive arrows in opposite directions). The lower half of the circles represents the converted 4D energy into 3D of the more negative plane and the upper half, the positive 4D region. Diagram (c) simply gives more information than (b).

These diagrams (a), (b) and (c) are merely convenient ways of expressing these conditions. Returning to (d), the 3D component which lags 90 degrees overlaps with the 4D half cycle providing interaction of this secondary electromagnetic vortex with the primary 4D to 3D vortex.

This **interference** of the 4D primary and 3D secondary vortices creates shells around, for example, the center of the atom, just as interference of light waves creates fringes of light (compare shell), and dark (compare gap between shells) bands. Thus electronic shells are higher-dimensional "light" and "dark" bands. Spherical or 3D entities (particles) occur quite naturally and geometrically from interference of higher-dimensional energies. Thus our own consciousness interacting (interfering) with waves will produce particles **but** the necessary correspondence of the wavelength

may have to be provided by the experimental conditions, etc.

Now using Figure 48 we see that the interacting region consists of combinations of positives and negatives. In Figure 48 the shaded region is a 4D-positive and a 3D-positive which we can write as $+_4+_3$ and the quarter cycle preceding this is $+_4-_3$. These two shells are ingoing corresponding to electrons spiralling in (see chapter on vibrations) but have opposite spins just as is found to be the case with the electron. Note that these spin fourth-to-third dimensionally and the direction of spin **does not** change by changing the 3D viewpoint - as should be the case (that is, looking at the particle on the other side should not change its spin direction).

The opposites of these two will be obtained by the next half cycle, that is, $-_4+_3$ and $-_4-_3$. This is the positive or outgoing aspect of the atom corresponding to protons or the nucleus. These similarly will have opposite spins. Note that for compatibility of conventions we can reverse the 4D signs so that the negative corresponds to the electron shell, and the positive to the proton shell.

APPENDIX C

SUPERSYMMETRY

It always saddens one to hear of a scientific prediction made by some far-sighted physicist in our history which, as a result of failed efforts by other investigators to verify this, is then considered in error. Nobel Laureate Dirac sought to preserve symmetry of his theories, and in 1928 postulated a negative sea of energy, called antimatter, which is the mirror image or perfectly symmetrical counterpart to ordinary matter.

Amazingly, scientists began to discover more evidence for this - antiparticle counterparts to known particles. However, this earlier enthusiasm seems to be dwindling and physicists are now arriving at the conclusion that the universe is not afterall perfectly symmetrical with a balance between matter and anti-

matter, and that it is essentially made up of ordinary matter. Thus the ideal or dream of the physicist of a symmetrical universe is not being born out.

The problem here is that the framework within which these judgments are made is too geometrically narrow and too conceptually inadequate. As we have seen, the introduction of the fourth dimension gives natural symmetry to all energy and vibratory manifestations - all basic energy oscillates at right angles to our 3D space, that is, fourth dimensionally with the negative side in the anti-universe (see diagrams).

The lower man's consciousness becomes, the greater the separation in the gravity and antigravity components and the less there is perception of the unity of the opposites, which comprises the symmetry. High up the scale of consciousness the latter perceives the symmetry simultaneously, but as we come lower down the scale only one side is perceived more and more. Four-dimensional space gradually splits up into two 3D spaces (universes) in the fourth to third dimensional gradient. One is at right angles to the other. Thus each perceives the other in time. Antimatter therefore is matter in time and difficult to detect, particularly since it is already part of matter. It is, however, balanced in the gravity/antigravity oscillations of this dual-universe system. The gravity and antigravity universe as a pair is symmetrical but not each one **separately** to the degree governed by the conscious level or (ego development) of the civilization.

Thus at the level of human perception or observation of the macro world there apparently will be lack of symmetry, particularly with regard to time. The lower consciousness becomes, and the more ego development there is, the more we observe 3D particles but with a viewpoint biased to one side of the vibration giving perception of ordinary matter and mainly one flow of time and ordinary subatomic particles without antiparticles.

Supersymmetry inherently exists in the energy vibrations where the positive and negative (gravity/antigravity) components are balanced such as in "permanent" structures but many particles are fleeting and comprise only one side of the vibration positive

or negative; that is, spiralling only one way, in or out and the actual balance of the energy flows will not always be observable even without ego consciousness' bias. This supersymmetry, with its mirror-image opposites and balance point between the two poles, is the same structure as that which has been described throughout the main text of the book regarding karma, dichotomies and experiences of consciousness.

ESCAPE FROM THE UNIVERSE

- What does your future hold?
- Are you ready for existence in the higher-dimensional worlds referred to as Heaven, or are you a young being still involved with ego games and materialistic adventures? Or are you a negative entity who will choose the subastral planes of existence? (All levels are valid and needed in the overall structuring of the hierarchy of realms of existence). It is your choice!
- What is the purpose of life in the lower materialistic planes with its joys and tragedies? Is it constructive or random? Do you know how to avoid ego entrapment in these lower planes and what the key factor is which prevents freedom into the higher/realms.
- At this time, it is vital that each individual be aware of what possibilities are open to him or her.

These are some of the concepts handled in the book along with: Man's true origin; destiny of our planet and civilization; the nature of light vibrations; the true nature of the ego and what it means; life on other worlds and the nature of Heaven, and the relationship between man, the cosmos and the Infinite Creator, with scientific principles for the more technical reader in the appendices.

ABOUT THE AUTHOR: Noel Huntley graduated at Leeds University, England, with an honors degree in Special Physics, and pursued a career in nuclear physics for seven years working at the Atomic Research Establishment, Aldermaston, England.

Other books by the author are: **SUPERHUMAN - Man's Ultimate Physical and Spiritual Abilities; THE HIDDEN VARIABLES OF PIANO TECHNIQUE AND THE FUNDAMENTALS OF SKILL**, and science fiction novels, **GALACTIC PLAN** and **ROBOTA**. More recently research has involved the application of fourth-dimensional physics to spacecraft propulsion, covered in his book **THE SECRETS OF FLYING SAUCER PROPULSION**, and also applications to the evolution of consciousness.
